

## Packaging a Module Into a JAR File

---

Before packaging a Java module into a JAR file, you need to [configure an artifact](#) of the type **JAR**. This artifact can define the output of one or more modules.

### To build a jar file from a module

1. On the main menu, choose **Build | Build Artifact**.
2. From the drop-down list, select the desired artifact of the type **JAR**.

The list shows all the artifacts configured for the current project. To have all the configured artifacts built, choose the **Build all artifacts** option.
