

Pulling Changes from the Upstream (Pull)

Refreshing a local Mercurial repository with the changes from the remote repository (*Pull*) involves retrieving changes and applying them to the local data . The Mercurial integration with IntelliJ IDEA provides interface for specifying the mandatory *Pull* settings and for customizing the *Pull* procedure.

To pull changes from a remote repository

1. On the main menu, choose **VCS | Mercurial | Pull Changesets**. The **Pull** dialog box opens.
2. Specify the required URL address of the source remote repository.
