

Removing Modules from a Project

You can remove unnecessary modules from your project. However, the files that make up the corresponding modules are not physically deleted. Thus, the modules you have removed from a project can later be added to the same or a different project.

To remove a module from a project

1. In the [Project tool window](#), select the module that you want to remove from the project.
2. Do one of the following:
 - Select **Remove Module** from the context menu.
 - Select **Edit | Remove Module**.
 - Press **Delete**.
