

# Replace Temp with Query Dialog

---

## Refactor | Replace Temp with Query

Item	Description
Name	Specify the name for the extracted method.
Declare static	Check this option to declare the method static. This option is enabled when the initial expression is static itself.
Parameters	In this area, select the parameters you want to be used in the extracted method. The parameters are all checked by default. If unchecked, the appropriate value will be used as a local variable in the extracted method.
Move Up/Down	Use this buttons to reorder parameters in the list.
Visibility	Here you can change the method's visibility scope.
