

## Resource Bundle

---

Resource bundle is a set of [properties files](#) that have same base name with different language-specific suffixes. A resource bundle contains at least two properties files with similar base name, for example `file_en.properties` and `file_de.properties`.

IntelliJ IDEA recognizes properties files, and if two or more properties files with the names that differ only in suffix, are encountered, joins them into a resource bundle. The new node **Resource Bundle '(base name)'** appears in the [Project Tool Window](#):

IntelliJ IDEA supports the following features for the resource bundles:

- Dedicated [Resource Bundle Editor](#)
- *Error highlighting* for the missing properties or values.
- *Refactoring* for resource bundles includes Rename, Move, Copy and Safe Delete.
