

## Safe Delete

---

If you execute the delete action from the Tapestry View you'll see that Loomy will actually figure out what Tapestry elements you're trying to delete and it will aggregate all it's file into this operation. So if for example you try to delete a page, Loomy will delete the page class, template and it's resource bundle.

IntelliJ IDEA will then look for usages of all the resulting files and you'll be able to, as usual, go through with the operation or cancel it.
