

Servlets

[Servlets](#) as a part of a Web application are created and configured through the `<servlet>` and `<servlet-name>` elements in the `web.xml` Web Application deployment descriptor.

IntelliJ IDEA provides a friendly interface for configuring servlets in the [Web Module Editor](#) window.

To define a servlet

1. Configure a [new servlet](#).
2. Click OK in the [New Servlet](#) dialog box. The new servlet is added to the list in the **Servlets Configured** pane.
3. Specify the servlet [initialization parameters](#).
4. Specify the servlet [context parameters](#).
