

Specifying Template Data Languages for Templates

When you use some *template engine* with IntelliJ IDEA to create a template, you need to specify the template data language for the template, to enable coding assistance and syntax highlighting.

To change template data language settings for a file, directory, or an entire project

1. [Open Project settings](#).
2. Select **Project Settings | Template Data Languages**.
3. In the **File/Directory** column click the desired item (a template file, a folder with template files, or an entire project). In the **Template data language** column select the underlying language from the drop-down list.
