

Type Migration Preview

Refactor | Type Migration | Preview

This view allows you to review type migration results and correct the scope of changes by excluding/including items from/to the refactoring.

The view consists of the following panes:

- The **upper left pane** displays the tree view of the items to be refactored. The root item in this tree view is the one you meant to refactor. Nodes represent all pieces of code that depend on this type.
- The **upper right pane** is a common Find Usages view.
- The **bottom pane** shows conflicts found.

Toolbar options for both **upper right** and **bottom** panes are similar to those of the [Find](#) tool window.

Here context menu options for the **upper left pane** are described.

Item	Shortcut	Description
Exclude	Delete	Select to exclude the item from the refactoring. It won't be changed.
Include	Insert	Select to include item to the refactoring.
Jump to Source	F4	Opens in the editor the file that contains the selected code fragment, and places the caret at the type.
