IntelliJ IDEA currently supports integration with Subversion 1.8.

Prerequisites

- IntelliJ IDEA comes bundled with Subversion plugin. This plugin is turned on by default. If it is not, make sure that the plugin is enabled.
- IntelliJ IDEA's Subversion integration does not require a standalone Subversion client. All you need is an account in your Subversion repository.
- Subversion [integration is enabled](#) for the current project root or directory.

Subversion support

- When the Subversion integration with IntelliJ IDEA is enabled, the **Subversion** item appears on the **VCS** menu, and on the context menus of the Editor and Project views.
- The files in the folders under the Subversion control are highlighted according to their status. See [File Status Highlights](#) for file status highlighting conventions.
- Results of modifications show in the [Changes tool window](#).
- When using the Subversion integration, it is helpful to open the [Version Control](#) tool window. Its [Console](#) tab displays the following data:
 - All the commands generated based on the settings you specify through the IntelliJ IDEA user interface.
 - Information messages concerning the results of executing generated Subversion commands.
 - Error messages.
