

Validating Dependencies

Analyzing dependencies you might need to exclude some of them from the analysis process. In other words, you can create your own rules for dependencies analysis.

To validate dependencies

1. In the toolbar of the [Dependency Viewer](#), click the Edit Rules  button. [Dependency Validation dialog](#) is opened.
2. Define the scopes of prohibited and allowed usages:
 1. Click **Add** button in the Deny/Allow sections to add the default scope.
 2. Click a scope entry in the **Deny/Allow usages of** column and select one of the pre-defined scopes from the drop-down list, or click the ellipsis button and define scope in the [Scopes](#) dialog.
 3. Click a scope entry in the **in / only in** column, and select one of the pre-defined scopes, or click the ellipsis button and define scope in the [Scopes](#) dialog.
 4. Use **Add** and **Remove** buttons to make up the complete list.
3. Apply changes. Dependency analysis reruns with the new rules.
