

# Viewing Pages with Web Contents

---

With IntelliJ IDEA, you can perform two opposite operations:

- Preview the output of your Web application in the browser to check whether the pages are rendered correctly. IntelliJ IDEA can display a page preview in a browser of your choice or you can switch between several browsers. IntelliJ IDEA currently supports previews in the following browsers:

- Mozilla Firefox
- Internet Explorer
- Safari
- Chrome
- Opera

No preliminary steps are required to view HTML code. However, to preview PHP pages in the browser, you need to [configure synchronization with a server](#) first.

- View the HTML source code of a Web page in the IntelliJ IDEA editor.
