

Viewing the GitHub Version of a File

You can view the GitHub copy of a file right from the IDE. IntelliJ IDEA detects which branch is currently active and opens the GitHub copy of the file in the corresponding branch.

To view the remote copy of a file

1. Open the file in the editor or select it in the [Project](#) tool window.
2. On the context menu, choose **Open in Browser**. The GitHub copy of the file in the remote version for the current branch opens.

If the command is invoked on a folder, the page with the information on the corresponding remote folder is displayed.
