

XPath Search

This new feature is the XML-aware counterpart to IntelliJ IDEA built-in functions *Find in Path* and *Search Structurally*: It allows you to find occurrences of certain XPath expressions in all XML files in a specific scope. It is available as **Find by XPath...** under the **Search** menu.

The scope that can be chosen is either the full project scope, a specific module or a simple directory. There's also the ability to use *custom* scopes, but this is somewhat limited as it will only scan XML files inside source-folders.

This dialog provides the same functionality regarding completion, error checking and intentions as described in [Evaluate Expression](#).
