- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Note** This setting is shared if you select to share your run/debug configuration, so the same method will be applied for your team members irrespective of their operating system.

The dialog opens when you click the  or the  buttons in the Logs tab of the [Run/Debug Configuration dialogs](#) .

Use this dialog to specify a file or a group of files that you want to be displayed on dedicated tabs of the [Run](#) or [Debug tool window](#) .

#### ItemDescription

---

Alias	In this text box, type the alias for the log entry. This alias will be displayed in the Logs tab and in the header of the dedicated tab of the <a href="#">Run</a> or <a href="#">Debug tool window</a> .
Log File Location	In this text box, specify the log files to display during running or debugging. Do one of the following: <ul style="list-style-type: none"><li>– Specify the full path to a specific file. Type the path manually or click the Browse button  and choose the file in the <a href="#">dialog that opens</a> .</li><li>– Specify the base directory and add an <a href="#">Ant pattern</a> that defines the <a href="#">fileset</a> to be displayed.</li></ul>
Show All Files Coverable by Pattern	Select this checkbox to have IntelliJ IDEA open a separate dedicated tab for each log file that matches the specified pattern.

---

Please note the following:

- If no alias is specified, the dedicated tab header shows the path to each log file.
- If a pattern covers more than one file, the tab header shows the name of the file instead of the log entry alias, even if an alias is specified.

Arquillian JUnit [run/debug configurations](#) let you run and debug your [Arquillian](#) JUnit tests. (The JBoss Arquillian Support [plugin](#) must be enabled.)

- [Name, Share, and Single instance only](#)
- [Arquillian Container tab](#)
- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Arquillian: a Quick Start Guide](#) .

## Name, Share, and Single instance only

### ItemDescription

Name	The name of the run configuration.
Share	<p>Select this checkbox to share the run configuration through version control. If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.</p> <p>If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.</p> <p>See <a href="#">Configuring projects</a> .</p>
Single instance only	If you select this checkbox, only one instance of the run configuration will run at a time.

## Arquillian Container tab

To configure your Arquillian containers, click [Configure](#) . Then select the container to be used.

See also, [Arquillian Containers](#) .

## Configuration tab

This tab lets you specify the settings for [JUnit](#) .

### ItemDescription

Test kind	From this drop-down list, select the scope for your tests and fill in the fields depending on your selection.						
All in package	<p>Select this option to run all unit tests in the specified package. Fill in the following fields:</p> <table border="1"> <tr> <td>Package</td> <td>Specify package name</td> </tr> <tr> <td>Search for tests</td> <td> <p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul> </td> </tr> </table>	Package	Specify package name	Search for tests	<p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul>		
Package	Specify package name						
Search for tests	<p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul>						
All in directory	<p>Select this option to run all unit tests in the specified directory. Fill in the following field:</p> <table border="1"> <tr> <td>Directory</td> <td>Specify the directory where you want to run the tests. It will act as the root directory for all relative input and output paths.</td> </tr> </table>	Directory	Specify the directory where you want to run the tests. It will act as the root directory for all relative input and output paths.				
Directory	Specify the directory where you want to run the tests. It will act as the root directory for all relative input and output paths.						
Pattern	<p>Select this option to run a set of test classes. This set may include classes located in the same or different directories, packages or modules. Fill in the following fields:</p> <table border="1"> <tr> <td>Pattern</td> <td> <p>Specify the required classes. Each class in this field must be represented by its fully qualified name. Class names must be separated with <code>  </code> . You can type class names manually, or click <a href="#">+</a> on the right (or press <code>Shift+Enter</code> ) and search for classes you want to add in the dialog that opens.</p> <p>You can also create a suite test, i.e. a bundle of several test classes that will be run together. To create a suite test class, click <a href="#">+</a> on the right and type the test classes you want to be run as a suite in the Configure suit tests dialog that opens. As a result, a new class will be created with the <code>@suite</code> annotation.</p> </td> </tr> <tr> <td>Method</td> <td>Specify the method to be launched (passed to the JRE). Type method name, or click <a href="#">...</a> and select the desired method in the dialog that opens.</td> </tr> <tr> <td>Search for tests</td> <td> <p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul> </td> </tr> </table>	Pattern	<p>Specify the required classes. Each class in this field must be represented by its fully qualified name. Class names must be separated with <code>  </code> . You can type class names manually, or click <a href="#">+</a> on the right (or press <code>Shift+Enter</code> ) and search for classes you want to add in the dialog that opens.</p> <p>You can also create a suite test, i.e. a bundle of several test classes that will be run together. To create a suite test class, click <a href="#">+</a> on the right and type the test classes you want to be run as a suite in the Configure suit tests dialog that opens. As a result, a new class will be created with the <code>@suite</code> annotation.</p>	Method	Specify the method to be launched (passed to the JRE). Type method name, or click <a href="#">...</a> and select the desired method in the dialog that opens.	Search for tests	<p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul>
Pattern	<p>Specify the required classes. Each class in this field must be represented by its fully qualified name. Class names must be separated with <code>  </code> . You can type class names manually, or click <a href="#">+</a> on the right (or press <code>Shift+Enter</code> ) and search for classes you want to add in the dialog that opens.</p> <p>You can also create a suite test, i.e. a bundle of several test classes that will be run together. To create a suite test class, click <a href="#">+</a> on the right and type the test classes you want to be run as a suite in the Configure suit tests dialog that opens. As a result, a new class will be created with the <code>@suite</code> annotation.</p>						
Method	Specify the method to be launched (passed to the JRE). Type method name, or click <a href="#">...</a> and select the desired method in the dialog that opens.						
Search for tests	<p>Select where in your project IntelliJ IDEA shall look for test classes related to the current package:</p> <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul>						
Class	<p>Select this option to run all tests in a class. Fill in the following field:</p>						

Class	Specify the fully qualified name of the class to be launched (passed to the JRE). Type the class name or click  and select the desired class in the dialog that opens.
Method	Select this option to run an individual test method. Fill in the following fields:
Class	Specify the fully qualified name of the class to be launched (passed to the JRE). Type the class name or click  and select the desired class in the dialog that opens.
Method	Specify the method to be launched (passed to the JRE). Type method name, or click  and select the desired method in the dialog that opens.
Category	Select this option if you only want to run test classes and test methods that are annotated either with the category given with the <code>@IncludeCategory</code> annotation, or a subtype of this category. <a href="#">Learn more about JUnit categories</a> . Fill in the following fields:
Category	Specify the desired category. Type category name, or click  and select the desired category in the dialog that opens.
Search for tests	Select where in your project IntelliJ IDEA shall look for test classes related to the current package: <ul style="list-style-type: none"> <li>– In whole project : IntelliJ IDEA will look for test classes in all project modules</li> <li>– In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li> <li>– Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li> </ul>
Fork mode	This option controls how many Java VMs will be created if you want to fork some tests. Select method or class to create a separate virtual machine for each method or class respectively. The available options in this drop-down list depend on the <a href="#">Test kind</a> setting.
Repeat	If you want to repeatedly run a test, select the threshold from this drop-down list. You can select to run your test once, n times (in this case specify the number of times in the field on the right), until the test fails, or until it is stopped.
VM options	If necessary, specify the string to be passed to the VM. This string may contain the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li> <li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code> .</li> </ul> If there is not enough space, you can click  and enter the string in the dialog that opens.  The <code>-classpath</code> option specified in this field overrides the classpath of the module.
Program arguments	In this field, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the required arguments in the dialog that opens. Use the same rules as for specifying the <a href="#">VM options</a> .
Working directory	Specify the directory that will act as the current directory when running the test. It will act as the root directory for all relative input and output paths. By default, the directory where the project file resides, is used as a working directory. Type directory name, or click  and select the desired directory in the dialog that opens. You can also click  to switch between directories.
Environment variables	Click  to open the Environment Variables dialog box where you can create variables and specify their values.
Use classpath of module	Select the module whose classpath should be used to run the tests.
JRE	Specify the JRE to be used. Select the JRE from the list, or click  and select the installation folder of the required JRE in the dialog that opens.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner.  
By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

 Finally, the line is considered covered if it is covered at least once.

**Packages and classes to record code coverage data** Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

**Do not use the optimized C runtime** Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

**Enable coverage in test folders.** If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

**Is Active** Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

**Log File Entry** The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

**Skip Content** Select this check box to have the previous content of the selected log skipped.

**Save console output to file** Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

**Show console when a message is printed to standard output stream** Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

**Show console when a message is printed to standard error stream** Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

 Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

 Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

 Click this button to remove the selected log entry from the list.

 Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

  Click this icon to add a task to the list. Select the task to be added, for example:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to compile the project.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to build an [artifact](#) or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.
- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

	Alt+Delete	Click this icon to remove the selected task from the list.
	Enter	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	Alt+Up / Alt+Down	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

	Alt+Insert	Create a run/debug configuration.
	Alt+Delete	Delete the selected run/debug configuration.
	Ctrl+D	Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
	Alt+Up / Alt+Down	Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.  To remove grouping, select a folder and click  .  See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .

Arquillian TestNG [run/debug configurations](#) let you run and debug your [Arquillian](#) TestNG tests. (The JBoss Arquillian Support [plugin](#) must be enabled.)

- [Name, Share, and Single instance only](#)
- [Arquillian Container tab](#)
- [Configuraion tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Arquillian: a Quick Start Guide](#) .

## Name, Share, and Single instance only

### ItemDescription

Name	The name of the run configuration.
Share	<p>Select this checkbox to share the run configuration through version control. If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.</p> <p>If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.</p> <p>See <a href="#">Configuring projects</a> .</p>
Single instance only	If you select this checkbox, only one instance of the run configuration will run at a time.

## Arquillian Container tab

To configure your Arquillian containers, click [Configure](#) . Then select the container to be used.

See also, [Arquillian Containers](#) .

## Configuraion tab

This tab lets you specify the settings for [TestNG](#) .

### ItemDescription

All in package	<p>Run all tests in a package. Package. The fully qualified name of the package.</p> <p>In whole project. IntelliJ IDEA will look for the tests in all the modules.</p> <p>In single module. IntelliJ IDEA will look for the tests only in the module that is selected in the <a href="#">Use classpath of module field</a> .</p> <p>Across module dependencies. The same as the previous option plus the modules that depend on that module.</p>
Suite	<p>Run a test suite. Suite. Specify the corresponding <code>testng.xml</code> file.</p>
Group	<p>Run a test group. Group. The group to be run. <a href="#">Learn more about TestNG groups</a> .</p>
Class	<p>Run a test class. Class. The fully qualified name of the test class to be run.</p>
Method	<p>Run a test method. Class. The fully qualified name of the test class.</p> <p>Method. The name of the method to be run.</p>
Pattern	<p>Run the tests that conform to the specified pattern. Pattern. Form the pattern by clicking <a href="#">+</a> and then selecting one or more TestNG test classes. Alternatively, click <a href="#">⊞</a> and type the pattern in the dialog that opens.</p>
Output directory	The directory in which test reports will be generated.
<b>JDK Settings</b>	
VM options	<p>Options and arguments to be passed to the JVM in which the tests run. When specifying the options, follow these rules:</p> <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li> </ul>

- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

The `-classpath` option specified in this field overrides the classpath of the module.

Test runner parameters	Arguments to be passed to the test runner. Use the same rules as for specifying the <a href="#">VM options</a> .
Working directory	The current working directory for the tests.
Environment variables	The environment variables to be passed to the corresponding JVM.
Use classpath of module	The module whose classpath is used when running the tests.
JRE	The JRE to be used.
Shorten command line	Select a method that will be used to shorten the command line if the classpath gets too long or you have many VM arguments that exceed your OS command line length limitation: <ul style="list-style-type: none"> <li>- none : IntelliJ IDEA will not shorten a long classpath. If the command line exceeds the OS limitation, IntelliJ IDEA will be unable to run your application and will display a message suggesting you to specify the shortening method.</li> <li>- JAR manifest : IntelliJ IDEA will pass a long classpath via a temporary <code>classpath.jar</code> . The original classpath is defined in the <code>manifest</code> file as a <code>class-path</code> attribute in <code>classpath.jar</code> . Note that you will be able to preview the full command line if it was shortened using this method, not just the classpath of the temporary <code>classpath.jar</code> .</li> <li>- classpath.file : IntelliJ IDEA will write a long classpath into a text file.</li> <li>- User-local default : this legacy option is set automatically for projects created before IntelliJ IDEA version 2017.3. IntelliJ IDEA will configure this setting depending on the properties set in the <code>ide/workspace.xml</code> and <code>idea.config.path/options/options.xml</code> files.</li> </ul>

#### Parameters

Properties file	Specify the <code>.properties</code> file to be passed to TestNG.
Name - Value	Additional parameters as key - value pairs.
Listeners	

  Use these icons to make up a list of listeners.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

#### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations. Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the	Select this check box to enable the option <code>--no-rcovrpt</code> . Use this option with discretion, since it significantly

optimized C runtime slows down performance.

Enable coverage in test folders. If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py`.

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li></ul>
	Select this check box to have the previous content of the selected log skipped.
	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>– Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a>.</li><li>– Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>– Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a>.</li><li>– Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a>.</li><li>– Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a>.</li><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

  Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)

Show this page  Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.

Activate tool window  If this checkbox is selected, the [Run](#) or the [Debug tool window](#) opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

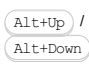

### ItemShortcutDescription

  Create a run/debug configuration.

  Delete the selected run/debug configuration.

  Create a copy of the selected run/debug configuration.

 View and edit the default settings for the selected run/debug configuration.

  Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

 You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#) .

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

In this dialog box, create configurations for debugging already running [Node.js](#) applications. This approach gives you the possibility to re-start a debugging session without re-starting the Node.js server.

On this page:

- [Getting access to the Run/Debug Configuration: Attach to Node.js/Chrome dialog](#)
- [Specific Attach to Node.js/Chrome configuration settings](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Attach to Node.js/Chrome dialog

1. **Install and enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager \(npm\)](#).

## Specific Attach to Node.js/Chrome configuration settings

### ItemDescription

Host	In this text box, specify the host where the application is running.
Port	In this text box, specify the port passed to <code>--inspect</code> or <code>--debug</code> when starting the Node.js process to connect to. Copy this port number from the information message in the <a href="#">Run</a> tool window that controls the running application.
Attach to	In this area, choose the debugging protocol to use: <ul style="list-style-type: none"><li>– Chrome or Node.js &gt; 6.3 started with <code>--inspect</code>: choose this option to use the <a href="#">Chrome Debugging Protocol</a>.</li><li>– Node.js &lt; 8 started with <code>--debug</code>: choose this option to use the <a href="#">V8 Debugging Protocol</a> (also known as Legacy Protocol).</li></ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the

same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

---

Alt+Up

Click this icon to move the selected task one line up in the list.

---

Alt+Down

Click this icon to move the selected task one line down in the list.

---

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This dialog box is available only when the **PHP** and **Behat** plugins are installed and enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) . Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

Use this dialog box to create a configuration to be used for running and debugging unit tests on PHP applications using the **Behat** framework.

On this page:

- [Before you start](#)
- [Test Runner area](#)
- [Command Line area](#)
- [Toolbar](#)
- [Common options](#)

## Before you start

To run **Behat** tests:

1. Install and configure the [Behat](#) framework on your computer as described in [Testing with Behat](#) .
2. Make sure the **PHP** and **Behat** plugins are installed and enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) . Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

## Test Runner area

In this area, specify the scenarios to launch and the command line switches to be passed to **Behat** .

### ItemDescription

Test scope	<p>In this area, specify the location of scenarios or the configuration file where they are listed.</p> <ul style="list-style-type: none"><li>– Directory: select this option to have all the scenarios in a directory launched. In the Directory text box, specify the directory to search for <code>.feature</code> files with scenarios in. Type the path to the directory manually or click the Browse button  and select the desired directory in the Choose Test Directory dialog box, that opens.</li><li>– File: select this option to have all the scenarios in a specific <code>.feature</code> file launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the <code>.feature</code> file to search the scenarios in. Type the path to the file manually or click the Browse button  and select the desired directory in the dialog box, that opens.</li><li>2. In the Class text box, specify the desired class. Type the class name manually or click the Browse button  and select the desired class in the tree view, that opens.</li></ol></li><li>– Scenario: select this option to have a specific scenario launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the <code>.feature</code> file to search for the scenario in. Type the file name manually or click the Browse button  and select the desired file in the tree view, that opens.</li><li>2. In the Scenario text box, specify the desired scenario.</li></ol></li><li>– Defined in the configuration file: select this option to have <b>Behat</b> execute the tests from a dedicated <code>.yaml</code> configuration file. By default, <b>Behat</b> uses the configuration file appointed in the Test Runner area of the <a href="#">Test Frameworks</a> page. In its turn, this can be either the native configuration file ( <code>behat.yaml</code> or <code>config/behat.yaml</code> ) or any other <code>.yaml</code> configuration file which you specified as <b>Default</b> during the initial configuration of Behat in IntelliJ IDEA.<ul style="list-style-type: none"><li>– To have the default for all Behat run configurations file used, clear the Use alternative configuration file checkbox.</li><li>– To launch scenarios from a custom configuration file, select the Use alternative configuration file checkbox and specify the location of the desired <code>.yaml</code> file in the text box next to it.</li><li>– To open the Behat page and specify another default configuration file to use, click the  button.</li></ul></li></ul>
------------	---

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

Interpreter options	<p>In this text box, specify the <a href="#">options</a> to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed.</p> <p>If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.</p>
Custom working directory	<p>In this text box, specify the location of the files that are outside the folder with tests and are referenced in your tests through relative paths.</p> <p>This setting does not block the test execution because the location of tests is always specified through a full path to the corresponding files and/or directories.</p> <p>By default, the field is empty and the working directory is the root of the project.</p>
Environment variables	<p>In this field, specify the <a href="#">environment variables</a> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a> for details.</p>

## Toolbar

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for Behave tests .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Feature files or folders	<p>In this text field, type the fully-qualified names of the feature files or directories which contain feature files.</p> <p>Multiple names should be delimited with   .</p> <p>Use the browse button to locate the desired paths in the file system.</p>
Params	<p>In this text field, type the Behave-specific parameters to be passed to the tests. IntelliJ IDEA provides the possibility to pass parameters to the test runner.</p> <p>In particular, the Behave parameters are described in the <a href="#">Tag expressions</a> section of the Behave documentation.</p>
Scenario	<p>Type the name of the scenario to be executed. If this field is left blank, all the available scenarios in the specified feature files will be executed.</p>
Environment	
Project	<p>Click this drop-down list to select one of the projects, <a href="#">opened in the same IntelliJ IDEA window</a> , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.</p>
Environment variable	<p>This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.</p> <p>To fill in the list, click the browse button, or press <code>Shift+Enter</code> and specify the desired set of environment variables in the Environment Variables dialog box.</p> <p>To create a new variable, click <code>+</code> , and type the desired name and value.</p>
Python Interpreter	
Interpreter options	<p>In this field, specify the string to be passed to the interpreter. If necessary, click <code>⌨</code> , and type the string in the editor.</p>
Working directory	<p>Specify a directory to be used by the running task.</p> <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	<p>This field appears, if a remote interpreter has been selected in the field Python interpreter .</p> <p>Click the browse button <code>⌨</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code>/<code>-</code> buttons to create new mappings, or delete the selected ones.</p>
Add content roots to PYTHONPATH	<p>Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;</p>
Add source roots to PYTHONPATH	<p>Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;</p>
Docker container settings	<p><b>Warning!</b> This field only appears when <a href="#">Docker-based remote interpreter</a> has been selected for a project.</p> <p><b>Note</b> Speaking about the correspondence of settings with some options (<code>--net</code> , <code>--link</code> , etc.), note that these options come from <a href="#">Docker command line arguments</a> .</p> <p>Click <code>⌨</code> to open the dialog and specify the following settings:</p> <ul style="list-style-type: none"><li>– <b>Disable networking</b> : select this checkbox to have the networking disabled. This corresponds to <code>--net="none"</code> , which means that inside a container the external network resources are not available.</li><li>– <b>Network mode</b> : corresponds to the other values of the option <code>--net</code> .<ul style="list-style-type: none"><li>– <code>bridge</code> is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed though this bridge to the container.</li></ul></li></ul> <p>Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.</p> <ul style="list-style-type: none"><li>– <code>host</code> : use the host's network stack inside the container.</li><li>– <code>container:&lt;name id&gt;</code> : use the network stack of another container, specified via its <code>name</code> or <code>id</code> .</li></ul> <p>Refer to the <a href="#">Network settings</a> documentation for details.</p> <ul style="list-style-type: none"><li>– <b>Links</b> : Use this section to link the container to be created with the other containers. This is applicable to <code>Network mode = bridge</code> and corresponds to the <code>--link</code> option.</li><li>– <b>Publish all ports</b> : This corresponds to the option <code>--publish-all</code> .</li><li>– <b>Port bindings</b> : Use this field to specify the</li></ul>

- Extra hosts : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- Volume bindings : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.  
  
See [Managing data in containers](#) for details.
- Environment variables : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li> </ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members.

If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

Single instance only If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

+

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

In this part:

- [Run Launcher](#)
- [Test Launcher \(JUnit\)](#)

## ItemDescription

Bnd run descriptor	Use this field to select bnd run descriptor that is represented in a form of either <code>*.bnd</code> or <code>*.bndrun</code> file. The descriptor contains the description of bundles, its options and the execution.
JRE	By default, the project JDK is used to run the bundles. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

## Toolbar

Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for a Capistrano task .

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Task name	Specify the name of the Capistrano task to be executed.
Task arguments	Specify the list of the arguments to be passed to the Capistrano task. The arguments should be separated with spaces.
Stages	Select the desired stage. Stages can be configured in the <code>config/deploy.rb</code> file that appears after capifying an application. If your project makes use of one stage only, the default stage corresponds to production . Refer to <a href="#">2.x Multistage Extension</a> for details.
Turn on invoke/execute tracing, enable full backtrace ( <code>--trace</code> )	Select this checkbox to turn on the standard Capistrano <code>--trace</code> option.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle  If this check box is selected, the script in question will be executed as specified in the `gemfile` .

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner  Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

Sampling  Select this option to measure code coverage with minimal slow-down.

Tracing  Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

Track per test coverage  Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results  When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data  Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime  Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders  If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py  If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one  This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:

- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.
- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the `-ng` argument.

If this check box is not selected, then the script is launched in a usual way, without Nailgun.

## Toolbar

## ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li></ul>
---	---	--

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

CloudBees Deployment [run/debug configurations](#) let you deploy your application artifacts to [CloudBees](#) . (The CloudBees integration [plugin](#) must be enabled.)

	<code>Alt+Delete</code>	Click this icon to remove the selected task from the list.
	<code>Enter</code>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<code>Alt+Up</code> / <code>Alt+Down</code>	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Debug tool window</a> opens when you start the run/debug configuration in the debug mode. Otherwise, the tool window isn't shown. However, when the configuration is running in the debug mode, you can open the Debug tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

	<code>Alt+Insert</code>	Create a run/debug configuration.
	<code>Alt+Delete</code>	Delete the selected run/debug configuration.

Ctrl+D

Create a copy of the selected run/debug configuration.

---

View and edit the default settings for the selected run/debug configuration.

---

Alt+Up /  
Alt+Down

Move the selected run/debug configuration up and down in the list.  
The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

---

You can group run/debug configurations by placing them into folders.  
To create a folder, select the configurations to be grouped and click . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#).

CloudBees Server [run/debug configurations](#) let you deploy and debug applications intended for [CloudBees](#) locally. (The CloudBees integration [plugin](#) must be enabled.)

The Tomcat instance embedded in CloudBees is used as a server. This Tomcat instance is included in the server client libraries. You can download those libraries using a quick fix provided right in the run configuration:

If the message *Error: Client libraries were not downloaded* is shown in the lower part of the dialog, click Fix .

- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Before Launch options](#)
- [Toolbar](#)

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab

### ItemDescription

After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  ( <code>Shift+Enter</code> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. Most likely, the default <code>http://localhost:8080</code> will do.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg" .</code></li> <li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\" .</code></li> </ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). <ul style="list-style-type: none"> <li>- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li> <li>- Redeploy. The application artifact is rebuilt and redeployed.</li> <li>- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.</li> </ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

HTTP port	The server HTTP port.
JNDI port	The server JNDI port.

## Deployment tab

Specify an [artifact](#) or an external resource to be deployed on the server. (An external resource means a deployable Web component such as a WAR file which is not represented by a project artifact.)

There should be exactly one item in the deployment list. "Exploded" artifacts cannot be used.

To add an item to the list, click  and do one of the following:

- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#).

 () removes the selected items from the list.

 () opens the [Artifacts page](#) of the [Project Structure dialog](#) for the selected artifact.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li> </ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

#### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. This dialog box is available only when the PHP and Codeception plugins are installed and enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#). Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

Use this dialog box to create a configuration to be used for running and debugging unit tests on PHP applications using the [Codeception](#) framework.

On this page:

- [Before you start](#)
- [Test Runner area](#)
- [Command Line area](#)
- [Common options](#)

## Before you start

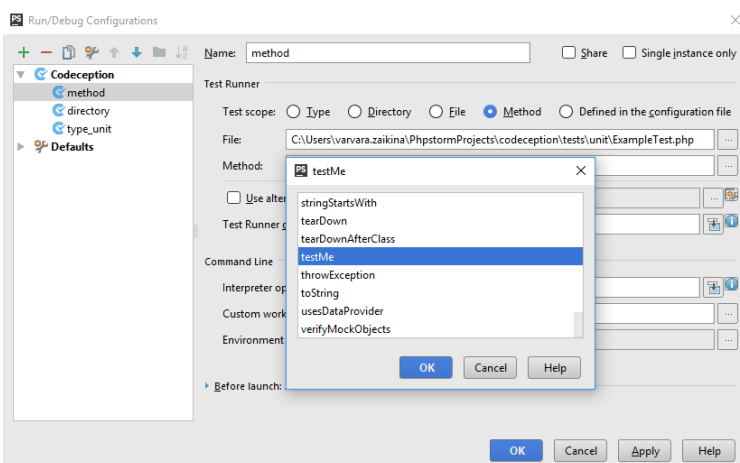

Install and configure the [Codeception](#) framework on your computer as described in [Testing with Codeception](#).

## Test Runner area

In this area, specify the tests to launch and the command line switches to be passed to [Codeception](#).

### ItemDescription

- Test scope
- In this area, specify the location of unit tests or the configuration file where they are listed.
- Type: select this option to launch the tests of a specific type. From the drop-down list, choose the type of test to run: acceptance, functional, or unit. Choose All to launch all the tests regardless of their type that are detected recursively in the folder specified as `tests` in the current configuration file.
  - Directory: select this option to have all the tests in a directory launched.
- In the Directory text box, specify the directory to search for tests in. Type the path to the directory manually or click the Browse button  and select the desired directory in the Choose Test Directory dialog box, that opens.
- File: select this option to have all the tests in a specific file launched. In the File text box, specify the file with the tests to run.
  - Method: select this option to have a specific test method or function launched.
    1. In the File text box, specify the file to search for the test method or scenario in. Type the file name manually or click the Browse button  and select the desired file in the tree view, that opens.
    2. In the Method text box, specify the desired test function or method to run. Click the Browse button  and select the desired function from the list:

- Defined in the configuration file: select this option to have [Codeception](#) execute the tests from a dedicated `.ym1` configuration file.

By default, [Codeception](#) uses the configuration file appointed in the Test Runner area of the [Test Frameworks](#) page.

  - To have the default for all [Codeception](#) run configurations file used, clear the Use alternative configuration file checkbox.
  - To launch method/functions from a custom configuration file, select the Use alternative configuration file checkbox and specify the location of the desired `.ym1` file in the text box next to it.
  - To open the [Codeception](#) page and specify another default configuration file to use, click the  button.
- Test Runner options: In this text box, specify the command line options to be passed to [Codeception](#). For example, adding `-vvv -colors` as command line option results in debug verbosity of colored output messages. See [Codeception Console Commands: Run](#) for details.

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

- Interpreter options
- In this text box, specify the [options](#) to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed.
- If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a

new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.

Custom working directory	In this field, specify the folder from which tests will be executed, that is, the parent folder of the tests root as it is specified in the <code>paths</code> section of <code>codeception.yml</code> . By default, the field is empty and the working directory is the root of the project.
Environment variables	In this field, specify the <b>environment variables</b> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a> for details.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a>.</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug</li></ul>
---	---	---

configuration in the current project.

- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

A ColdFusion run/debug configuration enables you to deploy and run applications on the [ColdFusion](#) server.

Click [here](#) for the description of the options that are common for all run/debug configurations.

#### ItemDescription

Web Path	In this text box, specify the URL address that corresponds to the server root. The server side of <a href="#">deployment mappings</a> will be specified relative to this URL.
Browser	In this drop-down list, specify the Web browser to open the application in. The list shows all the <a href="#">Web browsers configured in the IDE</a> .

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources. Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li></ul>
---	---	---

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
<input type="checkbox"/> Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<input type="checkbox"/> Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Ruby or Python Plugin is installed and enabled!

Use this dialog box to create configurations containing multiple run/debug configurations that you can launch at once. This is useful, for example, if you want to launch various automated tests and get test results in one window.

Press **+** to select which of the existing configurations you want to include into the Compound configuration, and fill in the following fields:

#### ItemDescription

Name	Specify the name of the new Run/Debug Configuration.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for Cucumber features.

The dialog box consists of the following tabs:

- Configuration tab
- Bundler tab
- Code Coverage tab
- Nailgun tab
- Logs tab

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Mode	Click one of the radio buttons to define the scope of features: <ul style="list-style-type: none"><li>- All features in a folder : Click this radio button, if you want to run all features in a directory.</li><li>- Feature file : Click this radio button, if you want to run the specified feature only.</li></ul>
Feature folder	Specify the fully qualified path to the directory that contains the desired features, or click <input type="button" value="..."/> and select the features directory in the <a href="#">dialog that opens</a> . This field is only available, when the All features in folder option is selected.
Feature file	Specify the name of the script to be executed.  This field is only available, when the Feature file option is selected.
Element name filter	IntelliJ IDEA will execute the feature elements with the names that contain matching substrings ( <code>-n, --name NAME</code> ).
Tags filter	Specify the tags to be considered on running tests ( <code>-t, --tags TAGS</code> ).
Runner options	Enter runner options.  <b>Note</b> It is important to note that step definitions that reside outside the <code>Features</code> directory, can be skipped by IntelliJ IDEA, and the tests will fail to run . Thus, if you want to make use of the step definitions located elsewhere, you have to specify the required directory with the step definition files, or individual step definition files. To do that, add <code>--r &lt;file or directory name&gt;</code> to the Runner options field.  If the path to a step definition file or directory is relative, it is relative to the Working directory defined in this run/debug configuration.
'cucumber' gem	Use this drop-down list to select the desired gem version, which will be used to run the tests. The list shows the versions that are available in the Ruby SDK. By default, the latest available version is taken.
Use custom Cucumber runner script	Select this checkbox if you want to use an alternative Cucumber runner script. You can type the fully qualified path to the Cucumber runner script in the text field, or click <input type="button" value="..."/> , and select the desired runner script in the <a href="#">dialog that opens</a> .
Output full backtrace	Select this check box to enable the <code>--trace</code> option.
Show the files and features loaded	Select this checkbox to enable the <code>-v, --verbose</code> option.
Use pre-loaded server	From the drop-down list, select the server to be used for executing scripts or examples.  Select None if you want to execute a test script or example locally, without any server.  <b>Tip</b> If both Zeus and Spork DRb servers are running simultaneously, it is Zeus that gets priority.  If a pre-loaded server is already running, it will be selected from the drop-down list.  Note that Cucumber features can be run under Zeus server up to version 0.13.4.pre2.  Refer to <a href="#">Executing Tests on DRb Server</a> or <a href="#">Executing Tests on Zeus Server</a> for details.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box. Formerly, the environment variable <code>RAILS_ENV</code> has been implicitly set to <code>cucumber</code> , if the user has not explicitly set any other value of this variable.  Now this setting is not used any more. If defining the environment variable <code>RAILS_ENV</code> is required, the Cucumber default run/debug configuration should be edited.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle If this check box is selected, the script in question will be executed as specified in the `gemfile` .

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

Sampling Select this option to measure code coverage with minimal slow-down.

Tracing Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

Track per test coverage Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders. If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:

- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.
- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the `-ng` argument.

If this check box is not selected, then the script is launched in a usual way, without Nailgun.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

## ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription**  
**shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#).  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

	<input type="button" value="Alt+Delete"/>	Run JRuby compiler : choose this option to execute JRuby compiler with the option to target the platform, compiler process heap size, and command line parameters (if any). Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
<input type="checkbox"/> Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<input type="checkbox"/> Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Cucumber run/debug configuration enables you to run features or scenarios via the `cucumber.cli.main` class.

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

## Configuration tab

### ItemDescription

**Main class** In this text box, specify the fully qualified name of the class with the `main()` method. This class is taken from the jar archive attached when [enabling Cucumber support](#) in project.  
By default, the main class name is `cucumber.cli.Main` .

Type the class name manually or click the Browse button  to open the Choose Main Class dialog box, where you can find the desired class by name or search through the project.

**Glue** In this text field, specify the name of the package, where [step definitions](#) are stored.

**Feature or folder path** Specify here the fully qualified path to the directory that contains the desired features, or click  and select the features directory in the dialog that opens.

**VM options** In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as `-mx` , `-verbose` , etc.  
If necessary, click  and type the desired string in the VM Options dialog.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

The `-classpath` option specified in this field overrides the classpath of the module.

**Program arguments** In this text box, type a list of arguments to be passed to the program in the format you would use in the command line.  
If necessary, click the  button and type the desired arguments in the Program Parameters dialog box.  
Use the same rules as for specifying the [VM options](#) .

**Working directory** In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the [dialog that opens](#) .  
Click this  icon to view the list of available [path variables](#) that you can use as a path to your working directory.

**Note** The list of the path variables may vary depending on the enabled plugins.

**Environment variables** Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.  
Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.

**Use classpath of module** Select the module whose classpath should be used to run the application.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner.  
By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View, taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with +; the ones to be excluded are marked with -.

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt`. Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py`.

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#).

Log File Entry The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content Select this check box to have the previous content of the selected log skipped.

Save console output to file Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#).

Show console when a message is printed to standard output stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

 Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

 Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#).

 Click this button to remove the selected log entry from the list.

 Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

  Click this button to add a new configuration to the list.

  Click this button to remove the selected configuration from the list.

  Click this button to create a copy of the selected configuration.

 Edit defaults Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

  or  Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations

appear in the Run/Debug drop-down list on the main toolbar.

	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

	 Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>grunt-cli</code> package.</li><li>– Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the <code>Gulpfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>gulp</code> package.</li></ul>
---	---

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

In this dialog box, create configurations for running and debugging JavaScript unit tests using the `Cucumber.js` test runner .

## Getting access to the Run/Debug Configuration: Cucumber.js dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#) .
3. Using the [Node Package Manager](#) , install the [Cucumber.js](#) as described in [Cucumber.js](#) .
4. Install and enable the [Cucumber.js](#) and [Gherkin](#) plugins. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) . Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

## Cucumber.js-specific configuration settings

**Tip** If you create a run/debug configuration from the editor by choosing Create Scenario:<Scenario\_name> on the context menu of the scenario to run, IntelliJ IDEA fill in the name of the scenario in the Name Filter text box automatically.

### ItemDescription

Feature file or directory	In this text box, specify the tests to run.  <b>Tip</b> Cucumber.js runs tests that are called <a href="#">features</a> and are written in the <a href="#">Gherkin</a> language. Each <a href="#">feature</a> is described in a separate file with the extension <code>feature</code> .  Type the path to a specific <code>.feature</code> file or to a folder, if you want to run a bunch of features.
Cucumber.js arguments	In this text box, specify the command line arguments to be passed to the executable file, such as <code>-r ( --require LIBRARY DIR ) , -t ( --tags TAG_EXPRESSION ) , or --coffee</code> . For details, see native built-in help available through the <code>cucumber-js --help</code> command.
Name Filter	In this text box, optionally type the name of a specific scenario to run instead of all the scenarios from the feature file or directory.
Executable path	In this text box, specify the location of the <code>cucumber-js.cmd</code> , <code>cucumber-js.bat</code> , or other depending on your operating system. The location depends on the installation mode. Type the path manually or click the Browse button  and choose the file in the dialog box that opens.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

Single instance only If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning:** Before you start, install and activate the Dart repository plugin on the [Plugins page](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

In this dialog box, create a configuration for running and debugging Dart code executed by [Dart VM](#).

On this page:

- [Dart Command Line Application-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Dart Command Line Application-specific configuration settings

### ItemDescription

Name	In this text box, specify the name of the run/debug configuration.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Dart file	In this text box, specify the Dart file to start the application from. The file must contain a <code>main()</code> method.
VM options	In this text box, specify the <a href="#">options to launch the Dart Virtual Machine with</a> .
Program arguments	In this field, optionally type the arguments to start the application with.
Working Directory	By default, the field is empty and the Dart package root is used as the working directory.
Environment Variables	In this field, optionally specify the environment variables for your Dart application. Click  to open the Environment Variables dialog box, where you can create variables and specify their values. You can also copy and paste the contents of the field without opening the Environment Variables dialog box.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription  
shortcut**

- +** **Alt+Insert** Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and

command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning:** Before you start, install and activate the Dart repository plugin on the [Plugins page](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

In this dialog box, create configurations to debug Dart applications on a remote [Dart VM](#).

On this page:

- [Dart Remote Debug-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Dart Remote Debug-specific configuration settings

### ItemDescription

Host	specify the address of the computer where the Dart Virtual Machine is running, the default value is <code>localhost</code> .
Port	In this field, specify the port for the debugger to communicate with the remote DartVM. The specified port is shown in the Use the command line arguments when starting the remote VM read-only field. Note that a remote application must be started exactly with these arguments.
Search Sources in	choose the Dart project to debug if your IntelliJ IDEA project contains <a href="#">several Dart projects</a> configured as content roots. See <a href="#">Adding a Dart project (package) to an IntelliJ IDEA project</a> .
Use these command line arguments when starting the remote VM	This read-only field shows the port specified in the Port field. Copy the contents of the Command line arguments for the remote Dart VM field. You will later pass them to the one who will launch the application on a remote host.

## Toolbar

### ItemShortcutDescription

	<code>Alt+Insert</code>	Click this button to add a new configuration to the list.
	<code>Alt+Delete</code>	Click this button to remove the selected configuration from the list.
	<code>Ctrl+D</code>	Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	<code>Alt+Up</code> or <code>Alt+Down</code>	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each

runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

-   Click this icon to add a task to the list. Select the task to be added:
  - Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

-   Click this icon to remove the selected task from the list.
-   Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
-   Click this icon to move the selected task one line up in the list.
-   Click this icon to move the selected task one line down in the list.

Show this page

Select this check box to have the run/debug configuration settings shown

prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning:** Before you start, install and activate the Dart repository plugin on the [Plugins page](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

In this dialog box, create configurations for running and debugging Dart tests that are written using the [dart test package](#). You can run tests on any [target platform](#), debugging is supported only for VM tests.

On this page:

- [Dart Test-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Dart Test-specific configuration settings

**Tip** If All in Folder is chosen, the test runner looks for tests only in the files with the names in the format `*_test.dart`.

### ItemDescription

Test Mode	<p>From this drop-down list, choose the scope of tests to run. The available options are:</p> <ul style="list-style-type: none"><li>– All in File: choose this option to have IntelliJ IDEA run all the tests in a file.</li><li>– All in Folder: choose this option to have IntelliJ IDEA run all the tests from the files in a folder.</li><li>– Group or test by name: choose this option to have IntelliJ IDEA run a specific <a href="#">test</a> or a <a href="#">group</a> of tests.</li></ul> <p>Depending on the chosen test scope, specify the path to the test file, test folder, or the name of the test or test group.</p>
Test runner options	<p>In this area, specify additional <a href="#">test runner command-line options</a>. For example, to run tests in Chrome, type <code>-p Chrome</code>, see <a href="#">Restricting Tests to Certain Platforms</a> for details.</p>
Environment Variables	<p>In this field, optionally specify the environment variables for your Dart application. Click  to open the Environment Variables dialog box, where you can create variables and specify their values. You can also copy and paste the contents of the field without opening the Environment Variables dialog box.</p>

Alt+Down

Click this icon to move the selected task one line down in the list.

---

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create run/debug configuration for Django server .

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Python, make sure that Python plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Python SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Python](#)
- [Django](#)

## Configuration tab

### ItemDescription

Host	In this text box, specify the host name to be used.
Port	In this text box, specify the port number where the server will start.
Additional options	In this text box, specify the options of the <code>django-admin.py</code> utility. Refer to the <code>django-admin.py</code> and <code>manage.py</code> <a href="#">documentation</a> for details.
Run browser	Select this check box, if you want your Django application to open in the default browser. In the text field below, enter the IP address where your application will be opened.
Test server	If this checkbox is selected, a Django development server is launched with the test database.  If this checkbox is not selected, the development server will be used.
No reload	If this checkbox is selected, the <code>--noreload</code> option of the <code>runserver</code> command becomes enabled. If this checkbox is not selected, IntelliJ IDEA will not select it automatically, which means that debugging in autoreload mode is possible. Refer to the <a href="#">option description</a> for details.  This field is only available when the Test server checkbox is cleared.
Custom run command	Specify here the custom command you want to register with <code>manage.py</code> utility. Such command, being properly added to your project, becomes available via the <a href="#">Run manage.py task</a> command on the Tools menu.  Refer to the section <a href="#">Writing custom django-admin commands</a> for details.
Project	Click this drop-down list to select one of the projects, <a href="#">opened in the same IntelliJ IDEA window</a> , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.
Environment variable	This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.  To fill in the list, click the browse button, or press <code>Shift+Enter</code> and specify the desired set of environment variables in the Environment Variables dialog box.  To create a new variable, click <code>+</code> , and type the desired name and value.  By default, the variable <code>PYTHONUNBUFFERED</code> is set to 1.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>⌨</code> , and type the string in the editor.
Working directory	Specify a directory to be used by the running task. <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	This field appears, if a remote interpreter has been selected in the field Python interpreter .  Click the browse button <code>⌨</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.

Add content roots to PYTHONPATH Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

Add source roots to PYTHONPATH Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

Docker container settings **Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed though this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its `name` or `id`.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. <ul style="list-style-type: none"> <li>If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> </ul> </li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. <ul style="list-style-type: none"> <li>See also, <a href="#">Working with Artifacts</a> .</li> </ul> </li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. <ul style="list-style-type: none"> <li>This option is available only if you have already at least one run/debug configuration in the current project.</li> </ul> </li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. <ul style="list-style-type: none"> <li>Specify the location of the Node.js interpreter, the parameters to pass</li> </ul> </li> </ul>
---	---	---

to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for Django tests .

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Python, make sure that Python plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Python SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Python](#)
- [Django](#)

## Configuration tab

### ItemDescription

**Target** Specify the target to be executed. If the field is left empty, it means that all the tests in all the applications specified in `INSTALLED_APPS` will be executed.

- If you want to run tests in a certain application, specify the application name.
- To run a specific test case, specify its name after the application name, delimited with a dot.
- To run a single test method within a test case, add the test method name after dot.

Same rules apply to the doctests contained in the test targets. The test label is used as the path to the test method or class to be executed. If there is function with a doctest, or a class with a class-level doctest, you can invoke that test by appending the name of the test method or class to the label.

**Custom settings** If this checkbox is selected, Django test will run with the specified custom settings, rather than with the default ones. Specify the fully qualified name of the file that contains Django settings. You can either type it manually, in the text field to the right, or click the browse button, and select one in the [dialog box that opens](#) .

If this checkbox is not selected, Django test will run with the default settings, defined in the Settings field of the Django page. The text field is disabled.

**Options** If this checkbox is selected, it is possible to specify parameters to be passed to the Django tests. Type the list of parameters in the text field to the right, prepending parameters with '-' and using spaces as delimiters. For example:

```
--noinput --failfast
```

If this checkbox is not selected, the text field is disabled.

### Environment

**Project** Click this drop-down list to select one of the projects, [opened in the same IntelliJ IDEA window](#) , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.

**Environment variable** This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.

To fill in the list, click the browse button, or press `Shift+Enter` and specify the desired set of environment variables in the Environment Variables dialog box.

To create a new variable, click `+` , and type the desired name and value.

### Python Interpreter

**Interpreter options** In this field, specify the string to be passed to the interpreter. If necessary, click `⌘` , and type the string in the editor.

**Working directory** Specify a directory to be used by the running task.

- When a default run/debug configuration is created by the keyboard shortcut `Ctrl+Shift+F10` , or by choosing `Run` on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.
- When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

Path mappings This field appears, if a remote interpreter has been selected in the field Python interpreter .

Click the browse button  to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use  /  buttons to create new mappings, or delete the selected ones.

Add content roots to PYTHONPATH Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

Add source roots to PYTHONPATH Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

Docker container settings **Warning:** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note:** Speaking about the correspondence of settings with some options (`--net` , `--link` , etc.), note that these options come from [Docker command line arguments](#) .

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"` , which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net` .
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its name or id .

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all` .
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click  ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

## ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li></ul>
---	---	--

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Docker [run configurations](#) enable you to integrate [Docker](#) into your development process. Settings depend on the type of the Docker run configuration relevant to your needs. Some settings are common, while others are specific in each case.

**Note** Make sure that the Docker integration [plugin](#) is installed.

For more information, see [Running Docker images](#) .

On this page:

- [Common settings](#)
- [Docker Image run configuration settings](#)
- [Docker-compose run configuration settings](#)
- [Dockerfile run configuration settings](#)
- [Before launch](#)
- [Toolbar](#)

## Common settings

The following settings are available for any type of Docker run configuration:

### ItemDescription

Name	Specify the name of the run configuration.
Share	Select to share the run configuration through version control.  If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.  If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.  For more information, see <a href="#">Configuring projects</a> .
Single instance only	Select to run only one instance of the run configuration at a time.
Server	Select the Docker server configuration to be used.  To create a new configuration or edit an existing one, click  ( <code>Shift+Enter</code> ). For more information, see <a href="#">Docker</a> .

## Docker Image run configuration settings

The following settings are available for the *Docker Image* run configuration:

### ItemDescription

Image ID	Specify the ID of the image to run.
Container name	Specify an optional name for the container. If empty, Docker will generate a random name for the container.
Entrypoint	<a href="#">Override the default ENTRYPOINT set by the image</a> . Similar to using the <code>--entrypoint</code> option with <code>docker run</code> .
Command	<a href="#">Override the default CMD set by the image</a> . Similar to specifying the optional <code>COMMAND</code> argument after <code>docker run</code> .
Publish exposed ports to the host interfaces	Select All to expose all container ports to the host or select Specify to specify which container ports to bind.
Bind ports	Specify the list of <a href="#">port bindings</a> . Similar to using the <code>-p</code> option with <code>docker run</code> .
Bind mounts	Specify the list of <a href="#">volume bindings</a> . Similar to using the <code>-v</code> option with <code>docker run</code> .
Environment variables	Specify the list of <a href="#">environment variables</a> . Similar to using the <code>-e</code> option with <code>docker run</code> .
Command line options	Specify arbitrary options for the <code>docker run</code> command.  <b>Note</b> Not all <code>docker run</code> options are supported. If you would like to request support for some option, leave a comment in <a href="#">IDEA-161088</a> .
Command preview	Preview the resulting command that will be used to execute the run configuration.

## Docker-compose run configuration settings

The following settings are available for the *Docker-compose* run configuration:

### ItemDescription

Compose file	Specify the <a href="#">Docker Compose</a> file to use for this run configuration.
--------------	--

## Dockerfile run configuration settings

The following settings are available for the *Dockerfile* run configuration:

#### ItemDescription

Dockerfile	Specify the <a href="#">Dockerfile</a> to be used for this run configuration.
Image tag	Specify the name and tag for the built image. Similar to using the <code>-t</code> option with <code>docker build</code> .
Build args	<a href="#">Override the default build-time variables</a> . Similar to using the <code>--build-arg</code> option with <code>docker build</code> .
Run built image	Select to run a container based on the built image.
Container name	Specify an optional name for the container. If empty, Docker will generate a random name for the container.
Entrypoint	<a href="#">Override the default ENTRYPOINT set by the image</a> . Similar to using the <code>--entrypoint</code> option with <code>docker run</code> .
Command	<a href="#">Override the default CMD set by the image</a> . Similar to specifying the optional <code>COMMAND</code> argument after <code>docker run</code> .
Publish exposed ports to the host interfaces	Select All to expose all container ports to the host or select Specify to specify which container ports to bind.
Bind ports	Specify the list of <a href="#">port bindings</a> . Similar to using the <code>-p</code> option with <code>docker run</code> .
Bind mounts	Specify the list of <a href="#">volume bindings</a> . Similar to using the <code>-v</code> option with <code>docker run</code> .
Environment variables	Specify the list of <a href="#">environment variables</a> . Similar to using the <code>-e</code> option with <code>docker run</code> .
Command line options	Specify arbitrary options for the <code>docker run</code> command. <b>Note</b> Not all <code>docker run</code> options are supported. If you would like to request support for some option, leave a comment in <a href="#">IDEA-181088</a> .
Command preview	Preview the resulting command that will be used to execute the run configuration.

## Before launch

Specify tasks to perform before starting the run configuration.

#### ItemShortcutDescription

		Add a task to the list, for example: <ul style="list-style-type: none"><li>– Run External tool For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>– Run Another Configuration Execute another run configuration.</li><li>– Build Artifacts For more information, see <a href="#">Working with Artifacts</a></li><li>– Run Ant target For more information, see <a href="#">Ant</a>.</li><li>– Generate CoffeeScript Source Maps For more information, see <a href="#">CoffeeScript</a>.</li><li>– Run Maven Goal For more information, see <a href="#">Maven</a>.</li></ul>
		Remove the selected task from the list.
		Edit the selected task.
		Move the selected task one line up or down in the list, changing the order for performing the tasks.
Show this page		Select to show the run configuration settings before starting it.
Activate tool window		Select to open the <a href="#">Docker tool window</a> before starting the run configuration.

## Toolbar

#### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#).

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations to use for debugging applications locally in Firefox, versions 36 and higher. Note that remote debugging in Firefox is currently not supported at all.

On this page:

- [Firefox Remote-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Firefox Remote-specific configuration settings

### ItemDescription

Host	In this text box, specify the host where the application is running. Currently it is just <code>localhost</code> .
Port	In this spin box, specify the port the debugger will listen to. It must be the port that you specified when enabling debugging in <a href="#">Firefox</a> , see <a href="#">Debugging JavaScript in Chrome</a> . The default value is 6000.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.  <b>ItemKeyboardDescription shortcut</b>

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application</li></ul>
---	---	--

or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	Alt+Delete	Click this icon to remove the selected task from the list.
	Enter	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	Alt+Up	Click this icon to move the selected task one line up in the list.
	Alt+Down	Click this icon to move the selected task one line down in the list.
Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Use this dialog to create or edit Flash App [run/debug configurations](#) which let you run and debug your ActionScript and Flex applications.

Note that this run/debug configuration type is not available for [build configurations](#) whose output is a RLM or Library.

Also note that the settings depend on the target platform specified in the associated build configuration (Web, Desktop (AIR) or Mobile (AIR Mobile)).

## Name, Share and Single instance only

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration.
Share	<p>Select this checkbox to share the run configuration through version control.</p> <p>If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.</p> <p>If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.</p> <p>See <a href="#">Configuring projects</a> .</p>
Single instance only	If you select this checkbox, only one instance of the run configuration will run at a time.

## Build configuration and Override main class

### ItemDescription

Build configuration	Select the build configuration to be used.
Override main class	<p>Normally, the main application class is defined in the build configuration. If you want a different class to be used as the main application class, select this option and specify the class.</p> <p>Use <code>[...]</code> ( <code>( Shift+Enter )</code> ) to select the necessary class in the Select Main Class dialog.</p> <p>Optionally, change the application output file name suggested by IntelliJ IDEA in the Output file name field.</p>

## Settings specific to Web-targeted applications

### ItemDescription

What to Launch	<p>Select one of the following options:</p> <ul style="list-style-type: none"><li>- Build output. Use this option to run the generated SWF file using the associated HTML wrapper.</li><li>- URL or local file. Use this option to open a specified URL in a Web browser, or to run a specified local <code>.swf</code> file (either directly or using the corresponding <code>.html</code> wrapper). Type the desired URL in the field. Generally, this is going to be something like <code>http(s)://&lt;host&gt;:&lt;port&gt;/&lt;context-root&gt;</code> .</li></ul> <p>In the case of a local file, you can use <code>[...]</code> and select the necessary <code>.swf</code> or <code>.html</code> file in the dialog that opens.</p>
Launch with	<p>Specify the program to be used for running your application. You can use:</p> <ul style="list-style-type: none"><li>- The system default application, that is, the program associated with the target file type (HTML or SWF) in the operating system. Usually, this is a Web browser. For SWF files, this may also be a stand-alone Flash player.</li><li>- A Web browser.</li><li>- A Flash player.</li></ul> <p>To select the required program, click <code>[...]</code> to the right of the Launch with field, and then specify the program in the Launch With dialog:</p> <ul style="list-style-type: none"><li>- To select the system default application, just click System default application .</li><li>- To select the browser, click Browser and select the required browser from the list. Additionally, you can access the <a href="#">Web Browsers dialog</a> to adjust Web browser settings. To open this dialog, use <code>[...]</code> next to the list.</li><li>- To select the Flash player, click Flash Player and then click <code>[...]</code> next to the Flash Player field. Then, specify the location of the required Flash player in the <a href="#">dialog that opens</a> .<ul style="list-style-type: none"><li>- New instance (available only on macOS). Select the checkbox if you want a new instance of Flash Player to be started. Otherwise, if Flash Player is already running, a new window for the running instance will open.</li></ul></li></ul>
Use debugger from SDK	<p>Specify the Flex SDK that contains the debugger that should be used. (If you are using a Flex SDK 3 for compilation, a Flex SDK 4 is recommended for debugging.)</p> <p>If the corresponding SDK is already defined in IntelliJ IDEA, select the SDK from the list. Otherwise, click <code>[...]</code> (</p>

`Shift+Enter` ) and add a definition of the necessary SDK in the Configure SDK dialog that opens.

Place SWF file in a local-trusted sandbox If the [Build output option](#) is selected: select this checkbox if you want to register your application SWF file as trusted. Trusted SWF files can interact with any other SWF files. They can load data from anywhere, remote or local.

Technically, trusted SWF files are assigned to the [local-trusted sandbox](#) .

## Settings specific to Desktop-targeted applications (AIR)

### ItemDescription

**AIR Debug Launcher options** If necessary, specify the [AIR Debug Launcher](#) options. Use the same rules as for specifying the [program parameters](#) .

**Program parameters** Specify the parameters to be passed to the application.

- Use spaces to separate individual parameters.
- If a parameter includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
- If a parameter includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value\"` .

## Settings specific to Mobile device-targeted applications (AIR Mobile)

### ItemDescription

**Run on** Specify whether you want to use an emulator or a real Android or iOS device to run or debug your application:

- **Emulator.** Select this option to use a built-in emulator. Select the intended target device from the list. The figures shown to the right of the list are the screen characteristics of the selected target device and are just for your information.
- **Screen** is the screen size available to your application.
- **Full** is the full screen size of the device.
- **ppi** (pixels per inch) is the screen pixel density.

If the necessary device is not present in the list, you can select **Other** and specify the desired screen parameters in the corresponding fields.

– **Android device.** Select this option to run or debug your application using an Android mobile device.

**Note** – To be able to use an Android device for running or debugging your application, packaging your application for Android must be enabled in the associated build configuration (the [Enabled option](#) on the Android tab).

– Running or debugging an application using an Android device, normally, assumes installing the application package on the target device. For this operation to succeed, the mobile device must be connected to your computer using USB.

– **iOS Simulator.** (This option is available only on Mac computers.) Select this option to run or debug your application using an iOS device simulator. In the SDK field, specify the path to the Apple iOS SDK to be used. (The simulator is included in an Apple iOS SDK.)

You can click `...` (`Shift+Enter` ) and select the SDK installation folder in the [dialog that opens](#) .

**Note** To be able to use an iOS simulator for running or debugging your application, packaging your application for iOS must be enabled in the associated build configuration (the [Enabled option](#) on the iOS tab).

– **iOS device.** Select this option to run or debug your application using an iOS mobile device. If necessary, enable fast application packaging. (If fast packaging is enabled, the ActionScript bytecode is interpreted and not translated to machine code. As a result, packaging is performed faster but code execution is slower.)

**Note** – To be able to use an iOS device for running or debugging your application, packaging your application for iOS must be enabled in the associated build configuration (the [Enabled option](#) on the iOS tab).

– Running or debugging an application using an iOS device, normally, assumes installing the application package on the target device. For this operation to succeed, the mobile device must be connected to your computer using USB.

– If you are using the AIR SDK version 3.4 or later, the application package will be installed on the target device automatically. For earlier SDK versions, you'll have to initiate the installation manually.

**Debug on device over** For an Android or iOS device: specify how the device will communicate with your computer after the application has been installed and started:

– **Network.** Select this option if the device is going to communicate with your computer over the network.

**Note** Installing the application package on a device requires a USB connection.

– **USB.** Select this option if the device will be connected to your computer using USB. If necessary, change the port suggested by IntelliJ IDEA.

**ADL options (emulator)** For the emulator: if necessary, specify the [AIR Debug Launcher](#) (ADL) options. Use the same rules as for specifying the [program parameters](#) .

**App descriptor (emulator)** For the emulator: specify the application descriptor to be used. The available options refer to the descriptor-related settings in the associated build configuration.

– as set for Android means the corresponding settings on the Android tab.

– as set for iOS refers to the settings on the iOS tab.

Depending on the settings in the build configuration, the following cases are possible:

– as set for Android: <Android support is not enabled>. Generating the descriptor for Android is disabled. Use the [Enabled](#) checkbox on the Android tab if you want to enable the corresponding option.

– as set for Android: generated. An auto-generated descriptor will be used. If you want a template-based descriptor to be used instead, select the [Custom template option](#) and specify the template.

– as set for Android: <file\_name>.xml. The corresponding custom template will be used to generate the descriptor. The `<file_name>` in this case is the name of the template file that will be used.

The corresponding cases are also possible for the as set for iOS option.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration. The specified tasks are performed in the order that they appear in the list.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to be run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>– Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<input type="checkbox"/>		Select this checkbox to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

## Toolbar

### ItemDescription

 or 	Use this icon or shortcut to create a new run/debug configuration.
 or 	Use this icon or shortcut to delete the selected run/debug configuration.
 or 	Use this icon or shortcut to create a copy of the selected run/debug configuration.
	Click this button to edit the default settings for run/debug configurations.
 	Use these buttons to move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

Use this dialog to create or edit Flash Remote Debug [run/debug configurations](#) which let you debug applications (SWF files) that have already been compiled and, if necessary, packaged, and are ready to be run on a local or remote computer, or a mobile device.

To open this dialog, use  next to the list.</li><li>- To select the Flash player, click Flash Player and then click  next to the Flash Player field. Then, specify the location of the required Flash player in the <a href="#">dialog that opens</a> .</li></ul>
Place SWF file in a local-trusted sandbox	<p>For Web build configurations: select this checkbox if you want to register your test SWF file as trusted.</p> <p>Trusted SWF files can interact with any other SWF files. They can load data from anywhere, remote or local.</p> <p>Technically, trusted SWF files are assigned to the <a href="#">local-trusted sandbox</a> .</p>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration. The specified tasks are performed in the order that they appear in the list.

### ItemShortcutDescription

- +  Click this icon to add a task to the list. Select the task to be added:
  - Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run.

If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to be run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this checkbox to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

## Toolbar

### ItemDescription

 or 	Use this icon or shortcut to create a new run/debug configuration.
 or 	Use this icon or shortcut to delete the selected run/debug configuration.
 or 	Use this icon or shortcut to create a copy of the selected run/debug configuration.
	Click this button to edit the default settings for run/debug configurations.
 	Use these buttons to move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for executing a custom Ruby gem .

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Gem name	In this field, type the name of the gem whose executable script will be run.  Note that <a href="#">basic code completion</a> is available in this field:  Press <code>Ctrl+Space</code> to show the available gems.
Executable name	In this field, type the name of the script to run.  Note that <a href="#">basic code completion</a> is available in this field:  Press <code>Ctrl+Space</code> to show the available gem executables.
Arguments	In this field, type the command line arguments of the script.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.  <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.  <b>Tip</b> Finally, the line is considered <i>covered</i> if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type

the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
	Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	<p>This check box is only available for JRuby used as the project interpreter.</p> <p>When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:</p> <ul style="list-style-type: none"><li>- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li></ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	<p>The read-only fields in this column list the log files to show. The list can contain:</p> <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.

		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass</li> </ul>
---	---	---

to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Geronimo Server [run/debug configurations](#) let you deploy and debug your applications on [Apache Geronimo](#). (The Geronimo Integration [plugin](#) must be enabled.)

See the server documentation to find out which JRE version is compatible with the version of Geronimo that you are using.

Also note that Geronimo needs the `JAVA_HOME` or the `JRE_HOME` environment variable to be set.

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  (Shift+Enter) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" OR "some arg"</code>.</li> <li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="quoted_value"</code>.</li> </ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"> <li>– Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li> <li>– Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li> </ul>

- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog      Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

---

On frame deactivation      Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.)  
The options other than Do nothing have the same meanings as in the case of the [Update action](#) .

---

Username      Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.

---

Password      The password of the user specified in the [Username field](#) .

---

## Server tab for a remote configuration

### ItemDescription

Application server      Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.)  
Click Configure to create a new server configuration or edit an existing one. (The [Application Servers dialog](#) will open.)

---

After launch      Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( [Shift+Enter](#) ) to configure your web browsers.

---

With JavaScript debugger      If this checkbox is selected, the web browser is started with the JavaScript debugger enabled.  
Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

---

The field underneath After launch      Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.

---

On 'Update' action      Select the necessary option for the [Update application](#) function ( or [Ctrl+F10](#) in the Run or Debug tool window).  
The options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.

---

Show dialog      Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

---

On frame deactivation      Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.)  
The options other than Do nothing have the same meanings as in the case of the [Update action](#) .

---

JMX Port      The server JMX port.

---

Username      Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.

---

Password      The password of the user specified in the [Username field](#) .

---

Host      The fully qualified domain name or the IP address of the server host.

---

Port      The server HTTP port.

---

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use  . For more information, see the table below.

### ItemDescription

 or       Use this icon or shortcut to add an artifact or an external resource to the list.

- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

---

 or      Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 or  Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 Run /	Use to switch between the settings for the run, debug and code coverage modes.
 Debug /	
 Coverage	
Startup script	Specify the script to be used to start the server. Use default: <ul style="list-style-type: none"> <li>– If this checkbox is selected, the default script is used.</li> <li>–  in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).</li> <li>– Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>– To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a>.</li> <li>– To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul>

When specifying the parameters and options, follow these rules:

- Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" or "some arg"` .
- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

---

Shutdown script	<p>Specify the script to be used to stop the server.</p> <p>Use default:</p> <ul style="list-style-type: none"><li>- If this checkbox is selected, the default script is used.</li></ul> <p> in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).</p> <ul style="list-style-type: none"><li>- Clear this checkbox to change the parameters passed to the script or to specify a different script:</li><li>- To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li><li>- To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li></ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"><li>- Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li><li>- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li></ul>
Pass environment variables	<p>To pass specific variables to the server environment, select this checkbox and specify the variables:</p> <ul style="list-style-type: none"><li>- To add a variable, click  and specify the variable name and value in the Name and Value fields respectively.</li><li>- To remove a variable from the list, select the variable and click  .</li></ul>
Port	Use this field to change the debugger port.
Debugger Settings	Click this button to edit the debugger options on the <a href="#">Debugger page</a> of the <a href="#">Settings dialog</a> .

---

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

---

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

---

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

---

	<p> Click this icon to add a task to the list. Select the task to be added, for example:</p> <ul style="list-style-type: none"><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li></ul>
---	---

---

	Alt+Delete	Click this icon to remove the selected task from the list.
	Enter	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	Alt+Up / Alt+Down	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

	Alt+Insert	Create a run/debug configuration.
	Alt+Delete	Delete the selected run/debug configuration.
	Ctrl+D	Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
	Alt+Up / Alt+Down	Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .</p>

## Name field and Share option

### ItemDescription

**Name** Use this field to edit the name of the run/debug configuration.  
This field is not available when editing the run/debug configuration defaults.

**Share** Select this check box to make the run/debug configuration available to other team members.  
If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.  
  
If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.  
  
This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

**Application server** Select the server configuration to be used.  
Click Configure to create a new server configuration or edit an existing one. (The [Application Servers dialog](#) will open.)

**After launch** Select this checkbox to start a web browser after starting the server and deploying the artifacts.  
Select the browser from the list. Click  ( `Shift+Enter` ) to configure your web browsers.

**With JavaScript debugger** If this checkbox is selected, the web browser is started with the JavaScript debugger enabled.  
Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

**The field underneath After launch** Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.

**VM options** If necessary, specify the command-line options to be passed to the server JVM at the server start.  
If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m`.
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"`.
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"`.

**On 'Update' action** Select the necessary option for the [Update application](#) function ( or `Ctrl+F10`) in the Run or Debug tool window.  
The update options are different for exploded and packed artifacts.

For exploded artifacts, the available options are:

- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).
- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled.  
In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog      Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

---

On frame deactivation      Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the [Update action](#) .

---

JRE      By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

---

Server Domain      Select the server domain to be used (to deploy and run your application).

---

Username      Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.

---

Password      The password of the user specified in the [Username field](#) .

---

Preserve Sessions Across Redeployment      For GlassFish Server 3 or later versions: select this checkbox to preserve active HTTP sessions when redeploying your application artifacts.

## Server tab for a remote configuration

### ItemDescription

---

Application server      Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The [Application Servers dialog](#) will open.)

---

After launch      Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( [Shift+Enter](#) ) to configure your web browsers.

---

With JavaScript debugger      If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

---

The field underneath After launch      Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.

---

On 'Update' action      Select the necessary option for the [Update application](#) function ( or [Ctrl+F10](#)) in the Run or Debug tool window. The options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.

---

Show dialog      Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

---

On frame deactivation      Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the [Update action](#) .

---

Domain Admin Server Port      GlassFish domain administration server port.

---

Username      Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.

---

Password      The password of the user specified in the [Username field](#) .

---

Deploy Target      Specify the following information for the target server:

- Domain. Select this option if the server operates in the domain mode. Virtual server. To deploy onto a particular virtual server in the target domain, specify the name of the virtual server. Otherwise, the artifacts are deployed onto all the virtual servers in the domain.
- Cluster. Select this option if the server operates in the cluster mode. Cluster Name. Specify the name of the target cluster.

Domain Admin Server Host. Specify the fully qualified domain name or the IP address of the domain administration server host.

---

Use SSL connection      Select this checkbox to connect to the server using SSL.

---

Preserve Sessions Across Redeployment      For GlassFish Server 3 or later versions: select this checkbox to preserve active HTTP sessions when redeploying your application artifacts.

Upload with GlassFish	Select this checkbox to deploy the application artifacts using the GlassFish Admin Console. Note that in this case you won't be able to deploy exploded artifacts to a remote server (i.e. if the server is actually on a different computer). If you use this option, you don't need to specify the remote staging settings.
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: <ul style="list-style-type: none"> <li>– Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host.</li> <li>– ftp. The <a href="#">File Transfer Protocol</a> or <a href="#">Secure FTP</a> is used.</li> <li>– Local or mounted folder. The staging environment is a local folder or is accessed as a <a href="#">mounted folder</a> .</li> </ul> <p>If the list is empty, you have to <a href="#">enable the Remote Hosts Access plugin</a> which supports the corresponding functionality.</p>
Host	If Same file system is selected for Type , the only available option for Host is also Same file system . In all other cases, the list contains the existing configurations of the selected <a href="#">type</a> . So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.  Select an existing configuration or create a new one.  To create a new configuration: <ol style="list-style-type: none"> <li>1. Click  to the right of the list.</li> <li>2. In the <a href="#">Deployment dialog</a> , click <a href="#">+</a> .</li> <li>3. In the Add Server dialog, specify the configuration name, select the type, and click OK .</li> <li>4. On the <a href="#">Connection tab</a> , specify the settings in the Upload/download project files section. The rest of the settings don't matter.</li> <li>5. Click OK in the Deployment dialog.</li> </ol>
Staging	When deploying to the remote host, the application artifact or artifacts are placed into a staging folder which should be accessible to GlassFish Server. The settings in this section define the location of this staging folder. Note that if Same file system is selected for Type and Host , no settings in this section need to be specified.
Path from root	The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.
Mapped as	The absolute path to the staging folder in the local file system of the remote host.
Remote connection settings	The settings for accessing deployed applications.
Host	The fully qualified domain name or the IP address of the GlassFish Server host. When the target server operates in the cluster mode, this is the host of the GlassFish Server instance which the debugger should connect to.
Port	The server HTTP port, or, for a cluster, the HTTP port of the corresponding GlassFish Server instance.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:` .
- The folder that you are going to use for staging is `C:\shared\staging` .

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Staging/Path from root: `staging`
- Staging/Mapped as: `C:\shared\staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use [+](#) . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

-  or  Use this icon or shortcut to add an artifact or an external resource to the list.
- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

 or Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 or **F4** Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

**Use custom context root** If you want to assign a particular [context root](#) to an artifact or external resource, select the artifact or the resource, select the checkbox and specify the desired context root in the field underneath the checkbox.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 **Run /** Use to switch between the settings for the run, debug and code coverage modes.

 **Debug /**

 **Coverage**

**Startup script** Specify the script to be used to start the server.  
Use default:

– If this checkbox is selected, the default script is used.

 in this case opens the Default Startup Script dialog which shows the contents of the Startup script field

(readonly).

- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.  
When specifying the parameters and options, follow these rules:
    - Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
    - If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
    - If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

Shutdown script Specify the script to be used to stop the server.  
Use default:

- If this checkbox is selected, the default script is used.  
 in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).
- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.  
When specifying the parameters and options, follow these rules:
    - Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
    - If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
    - If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

Pass environment variables The way GlassFish Server is started cannot be changed by using environment variables. The server configuration file `domain.xml` should be changed instead. So, whatever you specify in this section, doesn't matter.  
To make the necessary changes to the configuration file, IntelliJ IDEA provides quick fixes. When you see a warning in the lower part of the dialog that certain settings are incorrect, you should click Fix . As a result, the necessary changes are made to `domain.xml` .

#### Example

When you select  Debug in the upper part of the tab, you see that there is a variable `JAVA_OPTS` with the value

```
-agentlib:jdwp=transport=dt_socket,address=127.0.0.1:9009,suspend=y,server=n
```

As stated before, the corresponding setting cannot be passed to the GlassFish Server JVM by means of `JAVA_OPTS` .

In the configuration file `<domain_name>/config/domain.xml` , by default, the corresponding value (the `debug-options` attribute of the `<java-config>` element) is

```
-agentlib:jdwp=transport=dt_socket,address=9009,server=y,suspend=n
```

So, in the lower part of the dialog, you see the warning *Debug settings are invalid...* .

Now, if you click Fix , the value in `domain.xml` changes to

```
-agentlib:jdwp=transport=dt_socket,address=9009,server=n,suspend=y
```

Port Use this field to change the debugger port.  
When the warning *Debug settings are invalid...* is shown, click Fix . This changes the port number in the GlassFish Server configuration file `domain.xml` . See also, [Pass environment variables](#) .

Debugger Settings Click this button to edit the debugger options on the [Debugger page](#) of the [Settings dialog](#) .

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These should be specified in the GlassFish Server configuration file <code>domain.xml</code> .
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

	 Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more</li></ul>
---	--

information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to compile the project.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to build an [artifact](#) or artifacts. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.
- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run.  
If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.  To remove grouping, select a folder and click  .  See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .

Google App Engine Deployment [run/debug configurations](#) let you deploy your application artifacts to [Google App Engine](#) .  
(The Google App Engine Integration [plugin](#) must be enabled.)

	<code>Alt+Up</code> / <code>Alt+Down</code>	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Debug tool window</a> opens when you start the run/debug configuration in the debug mode. Otherwise, the tool window isn't shown. However, when the configuration is running in the debug mode, you can open the Debug tool window for it yourself if necessary.

## Toolbar

Item	Shortcut	Description
	<code>Alt+Insert</code>	Create a run/debug configuration.
	<code>Alt+Delete</code>	Delete the selected run/debug configuration.
	<code>Ctrl+D</code>	Create a copy of the selected run/debug configuration.

View and edit the default settings for the selected run/debug configuration.

Alt+Up /

Move the selected run/debug configuration up and down in the list.

Alt+Down

The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

You can group run/debug configurations by placing them into folders.

To create a folder, select the configurations to be grouped and click . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#) .

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Gradle Project	Use this field to specify the location of your Gradle project. You can either enter it manually or click the Browse  button and point to the desired location in the <a href="#">dialog that opens</a> .  You can also click  button to select an available Gradle module from the list of registered Gradle modules in your existing IntelliJ IDEA project. The list has a tree structure that might be useful if you have a Gradle multi-module project.
Tasks	Use this field to specify external tasks for your Gradle project. Use spaces to separate one task from another.
VM Options	Use this field to specify VM options for your Gradle project. If you need more room to type, click  next to the field to access the VM options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li> <li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="quoted_value"</code> .</li> </ul>

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in

focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

 Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to

pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Grails run/debug configuration enables you to run and debug the Grails applications, tests and Web tests.

The dialog box consists of the following tabs:

- [Grails tab](#)
- [Code Coverage tab](#)
- [Maven Settings tab](#)

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

## Grails Tab

### ItemDescription

Module	Select application, for which this run/debug configuration is created. By default, the name of the current module is suggested.
Command line	Type a command to execute a particular target, for example, <code>run-app</code> , or <code>app-engine</code> . Alternatively, you can execute target as described in the section <a href="#">Running Grails Targets</a> .
VM Options	Specify the string to be passed to the VM for launching the application. This string may contain the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code> .</li></ul>
Environment Variables	Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.
Add <code>-classpath</code>	If this checkbox is selected, it means that the user intends to include the dependency directly, by passing <code>-classpath</code> to the command line.
Launch browser	By default, this checkbox is not selected and IntelliJ IDEA uses <code>http://localhost:8080/application_name</code> as default address. Select this checkbox to enter a different address in the field.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations. Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
Use bundled coverage.py	If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .
If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section <a href="#">Code Coverage</a> for details.	

## Maven Settings Tab

Use this tab to configure Maven settings for running and debugging your application. By default, the Use project settings checkbox is selected and IntelliJ IDEA uses the default settings specified in your project.

### ItemDescription

Work offline	If this option is checked, Maven works in the offline mode and uses only those resources that are available locally. This option corresponds to the <code>--offline</code> command line option.
Use plugin registry	Check this option to enable referring to the Maven Plugin Registry. This option corresponds to the <code>--no-plugin-registry</code> command line option.
Execute goals recursively	If this option is cleared, the build does not recur into the nested projects. Clearing this option equals to <code>--non-recursive</code> command line option.
Print exception stack traces	If this option is checked, exception stack traces are generated. This option corresponds to the <code>--errors</code> command line option.
Always update snapshots	Select this checkbox to always update snapshot dependencies.
Output level	Select the desired level of the output log, which allows plugins to create messages at levels of <i>debug</i> , <i>info</i> , <i>warn</i> , and <i>error</i> , or disable output log.
Checksum policy	Select the desired level of checksum matching while downloading artifacts. You can opt to fails downloading, when checksums do not match ( <code>--strict-checksums</code> ), or issue a warning ( <code>--lax-checksums</code> ).
Multiproject build fail policy	Specify how to treat a failure in a multiproject build. You can choose to: <ul style="list-style-type: none"> <li>Fail the build at the very first failure, which corresponds to the command line option <code>--fail-fast</code> .</li> <li>Fail the build at the end, which corresponds to the command line option <code>--fail-at-end</code> .</li> <li>Ignore failures, which corresponds to the command line option <code>--fail-never</code> .</li> </ul>
Plugin update policy	Select plugin update policy from the drop-down list. You can opt to: <ul style="list-style-type: none"> <li>Check for updates, which corresponds to the command line option <code>--check-plugin-updates</code> .</li> <li>Suppress checking for updates, which corresponds to the command line option <code>--no-plugin-updates</code> .</li> </ul>
Threads <small>(-T option)</small>	Use this field to set the <code>-T</code> option for parallel builds. This option is available for Maven 3 and later versions. For more information, see <a href="#">parallel builds in Maven 3</a> feature.
Maven home directory	Use this drop-down list to select a bundled Maven version that is available (for Maven2, version 2.2.1 and for Maven3, version 3.0.5) or the result of resolved system variables such as <code>MAVEN_HOME</code> or <code>MAVEN2_HOME</code> . You can also specify your own Maven version that is installed on your machine. You can click  and select the necessary directory in the <a href="#">dialog that opens</a> .
User settings file	Specify the file that contains user-specific configuration for Maven in the text field. If you need to specify another file, check the Override option, click the ellipsis button and select the desired file in the Select Maven Settings File dialog.
Local repository	By default, the field shows the path to the local directory under the user home that stores the downloads and contains the temporary build artifacts that you have not yet released. If you need to specify another directory, check the Override option, click the ellipsis button and select the desired path in the Select Maven Local Repository dialog.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new	Use this button to <a href="#">create a new folder</a> .

folder / Create new folder If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in

case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

This section provides descriptions of the [configuration-specific items](#), as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Module	Select application, for which this run/debug configuration is created. By default, the name of the current module is suggested.
Command line	Type a command to execute a particular target, for example, <code>run-app</code> , or <code>app-engine</code> . Alternatively, you can execute target as described in the section <a href="#">Running Grails Targets</a> .
VM Options	Specify the string to be passed to the VM for launching the application. This string may contain the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code>.</li></ul>
Environment Variables	Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.
Add --classpath	If this checkbox is selected, it means that the user intends to include the dependency directly, by passing <code>-classpath</code> to the command line.
Launch browser	By default, this checkbox is not selected and IntelliJ IDEA uses <code>http://localhost:8080/application_name</code> as default address. Select this checkbox to enter a different address in the field.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

Alt+Up

Click this icon to move the selected task one line up in the list.

Alt+Down

Click this icon to move the selected task one line down in the list.

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This run/debug configuration is intended for the [Groovy scripts](#) .

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Script path	Type the path to the Groovy script to be launched, or click the ellipsis button and select one from the tree view.
Module	Select the module the run/debug configuration is created for. By default, the name of current module is suggested.
VM Options	Specify the string to be passed to the VM for launching the Groovy script. This string may contain the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code> .</li></ul>
Script Parameters	Type the list of arguments to be passed to the Groovy Script, same way as if you were entering these parameters in the command line. Use the same rules as for specifying the <a href="#">VM options</a> .
Environment variables	Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.
Working directory	Specify the root directory for the files referenced in script.
Enable debug stacktrace	If this checkbox is selected, the detailed debug stacktrace is produced, including the Groovy method calls. This information can be helpful in case of exceptions.
Add module classpath to the runner	Select this checkbox to include a module classpath when you are running a Groovy script.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box,

the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

Item	Keyboard shortcut	Description
------	-------------------	-------------

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
<b>Show this page</b>	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<b>Active tool window</b>	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for running **Grunt.js tasks** .

On this page:

- [Getting access to the Run/Debug Configuration: Grunt dialog](#)
- [Grunt-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Grunt dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#) .
3. Install **Grunt** as described in [Installing Grunt](#) .

## Grunt-specific configuration settings

### ItemDescription

Gruntfile	In this field, specify the location of the <code>Gruntfile.js</code> file to retrieve the definitions of the tasks from. Select the path from the drop-down list or click the  button and choose the file from the dialog box that opens.
Tasks	In this field, specify the tasks to run. Do one of the following: <ul style="list-style-type: none"><li>– To run one task, select it from the drop-down list.</li><li>– To run several tasks, type their names in the text box using blank spaces as separators.</li></ul>
Force execution	Select this checkbox to have Grunt ignore warnings and continue executing the launched task until the task is completed successfully or an error occurs, if the checkbox is cleared, the task execution is stopped by the first reported warning.
Verbose mode	Select this checkbox to have the <i>verbose</i> mode applied and thus have a full detailed log of a task execution displayed.
Node Interpreter	In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a> .  If you have <a href="#">appointed one of the installations as default</a> , the field displays the path to its executable file.
Node Options	In this text box, type the Node.js-specific command line options to be passed to the Node.js executable file. See <a href="#">Node Parameters</a> for details.
Grunt-cli Package	In this field, specify the path to the globally installed <code>Grunt-cli</code> package installed globally See <a href="#">Installing Grunt.js</a> for details.
Environment Variables	In this field, specify the <a href="#">environment variables</a> for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens: <ul style="list-style-type: none"><li>– To define a new variable, click the Add toolbar button  and specify the variable name and value.</li><li>– To discard a variable definition, select it in the list and click the Delete toolbar button  .</li><li>– Click OK , when ready</li></ul> The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are: <ul style="list-style-type: none"><li>– <code>NODE_PATH</code> : A  -separated list of directories prefixed to the module search path.</li><li>– <code>NODE_MODULE_CONTEXTS</code> : Set to 1 to load modules in their own global contexts.</li><li>– <code>NODE_DISABLE_COLORS</code> : Set to 1 to disable colors in the REPL.</li></ul>

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for running **Gulp.js tasks** .

On this page:

- [Getting access to the Run/Debug Configuration: Gulp.js dialog](#)
- [Gulp.js-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Gulp.js dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#) .
3. Install the `gulp` package as described in [Installing Gulp.js](#) .

## Gulp.js-specific configuration settings

### ItemDescription

**Gulpfile** In this field, specify the location of the `Gulpfile.js` file to retrieve the definitions of the tasks from. Select the path from the drop-down list or click the  button and choose the file from the dialog box that opens.

**Tasks** In this field, specify the tasks to run. Do one of the following:

- To run one task, select it from the drop-down list.
- To run several tasks, type their names in the text box using blank spaces as separators.

**Arguments** In this text box, specify the arguments for tasks to be executed with. Use the following format:

```
--<parameter_name> <parameter_value>
```

For example: `--env development` .

For details about passing task arguments, see <https://github.com/gulpjs/gulp/blob/master/docs/recipes/pass-arguments-from-cli.md>

**Node Interpreter** In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in [Configuring Node.js Interpreters](#) .

If you have [appointed one of the installations as default](#) , the field displays the path to its executable file.

**Node Options** In this text box, type the Node.js-specific command line options to be passed to the Node.js executable file. See [Node Parameters](#) for details.  
In the **default** configuration, type `--harmony` in this text box to have IntelliJ IDEA build a tasks tree according to a `Gulpfile.js` written in **ECMA6** .

Technically, IntelliJ IDEA invokes `Gulp.js` and processes `Gulpfile.js` according to the **default Gulp.js run configuration** . However this is done silently and does not require any steps from your side. However, if your `Gulpfile.js` is written in **ECMA6** , by default IntelliJ IDEA does not recognize this format and fails to build a tasks tree. To solve this problem, specify `--harmony` as a Node parameter of the **default Gulp.js run configuration** .

**Gulp Package** In this field, specify the path to the `gulp` package installed **locally** , under the project root. See [Installing Gulp.js](#) for details.

**Environment Variables** In this field, specify the [environment variables](#) for the Node.js executable file, if applicable. Click the **Browse** button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:

- To define a new variable, click the **Add** toolbar button  and specify the variable name and value.
- To discard a variable definition, select it in the list and click the **Delete** toolbar button  .
- Click **OK** , when ready

The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:

- `NODE_PATH` : A `:` -separated list of directories prefixed to the module search path.
- `NODE_MODULE_CONTEXTS` : Set to 1 to load modules in their own global contexts.
- `NODE_DISABLE_COLORS` : Set to 1 to disable colors in the REPL.

Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Run | Edit Configurations

Shift+Alt+F10

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Module	From this drop-down list, select the IntelliJ IDEA module to apply this configuration to.
Use Super Dev Mode	Select this checkbox to use <a href="#">GWT Super Dev Mode</a> . In this case you can quickly recompile your code and check the output in a browser.
GWT Modules to Load	From this drop-down list, select the <a href="#">GWT module</a> to deploy.
VM options	<p>In this text box, specify the string to be passed to the VM. Usually this string contains the options such as <code>-mx</code> , <code>-verbose</code> , etc.</p> <p>Type the arguments right in the text box or in the VM Options dialog that opens when you click  .</p> <p>When specifying the options, follow these rules:</p> <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> Or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li></ul>
Dev Mode parameters	<p>In this text box, specify the parameters for the <a href="#">GWT development mode</a> . Type the parameters right in the text box or in the GWT Dev Mode Parameters dialog that opens when you click  .</p> <p>Use the same rules as for specifying the <a href="#">VM options</a> .</p>
Working directory	<p>In this text box, specify the current directory to be used by the running test. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the <a href="#">dialog that opens</a> .</p> <p>Click this  icon to view the list of available environment variables that you can use as a path to your working directory. In this case you do not need to specify any additional environment variables in the Environment variables field.</p> <div style="background-color: #ffff00; padding: 5px; margin-top: 10px;"><b>Note</b> The list of environment variables may vary depending on the enabled plugins.</div>
Environment variables	Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.
Server	Use this drop-down list to select a server for your application. IntelliJ IDEA uses <a href="#">Jetty Web server</a> as a default one.
Start Page	From this drop-down list, select the name of the <code>.html</code> file that implements the starting page of the application. This drop-down is still available even if you clear the Open in browser checkbox to run the application in the embedded GWT development mode without launching the browser.
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
Open in browser	<p>Select this checkbox to have IntelliJ IDEA launch the browser and show the application implemented in the specified GWT module. From the drop-down list, choose the browser to open. The preselected Default value means that the <a href="#">browser specified as default</a> at the IntelliJ IDEA will be launched.</p> <p>Contrary to previous IntelliJ IDEA versions, where this functionality was implemented through integration with the native GWT Development Mode window, now you can choose yourself whether to have the <a href="#">application opened in the browser</a> or not.</p>
with JavaScript debugger	Select this checkbox for IntelliJ IDEA to use a JavaScript debugger for your application.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in

focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

`Alt+Insert`

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | Heroku Deployment

Heroku Deployment [run/debug configurations](#) let you deploy your code and application artifacts to [Heroku](#). They also let you debug your applications.

For Heroku Deployment run/debug configurations to be available, the Heroku integration [plugin](#) must be enabled.

- [Main settings](#)
- [Before Launch options](#)
- [Toolbar](#)

## Main settings

### ItemDescription

Name	The name of the run configuration.
Share	Select this checkbox to share the run configuration through version control. If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.  If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.  See <a href="#">Configuring projects</a> .
Single instance only	If you select this checkbox, only one instance of the run configuration will run at a time.
Server	Select the cloud access configuration to be used. To create a new configuration, or to edit an existing one, click  ( <a href="#">Shift+Enter</a> ). For more information, see <a href="#">Heroku</a> .
Deployment	To deploy your source code, select the corresponding <a href="#">module</a> . To deploy an <a href="#">application artifact</a> , select the artifact. Only archive artifact formats can be used (e.g. WAR, EAR).
Use custom application name	By default, your application will have about the same name as the module or the artifact. To specify a different name, select the checkbox and specify the name in the field. (The application name defines its URL, <code>https://&lt;app-name&gt;.herokuapp.com/</code> .)
Debug Host	An Internet routable IP address of your computer or that of a router that redirects the debug connection from Heroku onto your local host.
Debug Port	The port to be used for debugging. This may be any unused port on your computer.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a>.</li><li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a>.</li><li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a>.</li><li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a>.</li><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Debug tool window</a> opens when you start the run/debug

configuration in the debug mode.

Otherwise, the tool window isn't shown. However, when the configuration is running in the debug mode, you can open the Debug tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders.</p> <p>To create a folder, select the configurations to be grouped and click . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a>.</p>

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for an interactive console .

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
IRB script	Specify the name of the IRB script that runs the console.
IRB arguments	Specify the list of the arguments to be passed to the IRB script. The arguments should be separated with spaces.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
-----------------------------	---

Sampling	Select this option to measure code coverage with minimal slow-down.
----------	---

Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
---------	---

Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.
-------------------------	---

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.
----------------------------------	--

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
---	---

	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .
---	--

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default,

all newly created patterns are enabled.

	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	<p>This check box is only available for JRuby used as the project interpreter.</p> <p>When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:</p> <ul style="list-style-type: none"><li>– If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>– If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li></ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	<p>The read-only fields in this column list the log files to show. The list can contain:</p> <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

Alt+Up or  
Alt+Down

Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder

Use this button to [create a new folder](#) .  
If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

J2ME run/debug configuration options vary depending on the SDK you are using to develop your mobile applications. This section describes the options that are specific for WTK and DoJa, as well as the general options that apply to both SDKs.

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
------	--

## WTK-specific options

#### ItemDescription

Jad/Class/OTA	Select, which of the following sources - Jad, MIDlet class or OTA - is used to be run/debugged. Each source has its own settings described below.
---------------	---

JAD	If you have selected to use Jad file as the source for running and debugging, you need only to specify its location in the Jad File .
-----	---

Class Settings	If you have selected to use MIDlet class as the source for running and debugging, specify the following options: <ul style="list-style-type: none"> <li>– MIDlet Class : Specify here the MIDlet class to run/debug.</li> <li>– User Defined Settings : Use this options group to view/introduce/delete/move MIDlet class settings defined by the user.</li> </ul>
----------------	--

OTA Settings	These options can be set, if you have selected to use OTA as the source for running and debugging. This functionality emulates wireless download of the software from the server. Therefore, it is necessary to have a working server with such service and the necessary suite (which you want to install and launch) on it. This service is completely dependent on the emulator vendor and IntelliJ IDEA does not provide it. So, it should be provided by the emulator or separately by the emulator vendor (for instance, like Nokia does). Thus, you need to have three items ready - a server, a service and tested suite on that server. Remember that the actual options list varies from emulator type. <ul style="list-style-type: none"> <li>– Install from URL : Specify the URL from which the necessary suite can be downloaded. Later on, this suite is installed on the emulator.</li> <li>– Force installation : Select this option to reinstall the suite, if it is already installed.</li> <li>– Install, run and remove : The suite is installed on the emulator, launched and removed afterwards.</li> <li>– Run/Remove previously installed : The previously installed suites are run or removed, respectively.</li> <li>– Update Suites : Click this button to update the list of suites present on the server.</li> </ul>
--------------	--

## DoJa-Specific Options

#### ItemDescription

Jam/Class	Select which of the files, Jam or IApplication Class, is to be run/debugged.
-----------	--

JAM	If you have selected to use Jam file as the source for running and debugging, you need only to specify its location in the Jam File field.
-----	--

Class Settings	If you want to use IApplication Class as source for running/debugging, specify its location in the IApplication Class field.
----------------	--

## General Options

#### ItemDescription

Device	Select one of the available devices for the current emulator.
--------	---

Open Preferences	Opens the emulator's Preferences dialog. For more information, refer to emulator's documentation.
------------------	---

Open Utils	Opens the emulator's Utilities dialog. For more information, refer to emulator's documentation.
------------	---

Emulator parameters	Type in/edit emulator parameters such as <code>-mx heap_size</code> or <code>traceall</code> .
---------------------	--

Use classpath and JDK of module	Select a mobile module from the list of modules configured in your project. The classpath and JDK of this module will be used to run your J2ME module with the current run configuration.
---------------------------------	---

## Toolbar

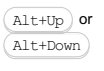

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
---	---	---

		Click this button to remove the selected configuration from the list.
---	---	---

		Click this button to create a copy of the selected configuration.
---	---	---

	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
---	---------------	--

		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
--	---	--

	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in
---	--	--

focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

 Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This run/debug configuration enables you to run applications started via `java -jar <name>.jar` command.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

**Path to JAR** Specify here the fully-qualified path to the required JAR file.

**VM options** In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as `-mx`, `-verbose`, etc.  
If necessary, click  and type the desired string in the VM Options dialog.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m`.
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"`.
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"`.

The `-classpath` option specified in this field overrides the classpath of the module.

**Program arguments** In this text box, type a list of arguments to be passed to the program in the format you would use in the command line.  
If necessary, click the  button and type the desired arguments in the Program Parameters dialog box.  
Use the same rules as for specifying the [VM options](#).

**Working directory** In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the [dialog that opens](#).  
Click this  icon to view the list of available [path variables](#) that you can use as a path to your working directory.

**Note** The list of the path variables may vary depending on the enabled plugins.

**Environment variables** Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.  
Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.

**JRE** By default, the newest JDK from the module dependencies is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

**Search sources using module's class path** Use the drop-down list to choose the required module. This option tells the debugger and the feature [Navigate from stacktrace](#), where the source code for the classes from JAR archive should be sought for.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner.  
By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#).

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View, taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

**Packages and classes to record code coverage** Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

data	
	<p>Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.</p> <p>The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .</p> <p>Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.</p>
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
Use bundled coverage.py	If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .
	<p>If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section <a href="#">Code Coverage</a> for details.</p>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	<p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

	<p><b>ItemKeyboardDescription</b></p> <p><b>shortcut</b></p>

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

Alt+Up

Click this icon to move the selected task one line up in the list.

---

Alt+Down

Click this icon to move the selected task one line down in the list.

---

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

The **Java Scratch** run/debug configuration enables you running or debugging **Java scratch** files that have the `main()` method.

Click [here](#) for the description of the options that are common for all run/debug configurations.

#### ItemDescription

**Main class** In this text box, specify the fully qualified name of the class to be executed (passed to the JRE). Type the class name manually or click the Browse button  to open the Choose Main Class dialog box, where you can find the desired class by name or search through the project.

**Path to scratch file** Specify here the path to the scratch file, or select one from the file chooser.

**VM options** In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as `-mx`, `-verbose`, etc.  
If necessary, click  and type the desired string in the VM Options dialog.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m`.
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"`.
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"`.

The `-classpath` option specified in this field overrides the classpath of the module.

**Program arguments** In this text box, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the desired arguments in the Program Parameters dialog box. Use the same rules as for specifying the **VM options**.

**Working directory** In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the [dialog that opens](#). Click this  icon to view the list of available [path variables](#) that you can use as a path to your working directory.

**Note** The list of the path variables may vary depending on the enabled plugins.

**Environment variables** Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.  
Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.

**Use classpath of module** Select the module whose classpath should be used to run the application.

**JRE** By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

**Enable capturing form snapshots** Select this check box to enable the [GUI Designer to take snapshots of the GUI components](#), that can be afterwards converted into a form.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
		Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	<b>Move into new folder / Create new folder</b>	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	<b>Sort configurations</b>	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default

run/debug configurations.

Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

- To learn more about Rake support, refer to [Rake Support](#) section.
- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create a configuration to be used for debugging JavaScript in applications running on the built-in or on an external web server and for debugging Dart web applications.

IntelliJ IDEA supports debugging applications running on the built-in or an external web server. Debugging can be performed only using [Google Chrome](#) and other browsers of the **Chrome** family. Debugging applications running on the built-in server is supported for Firefox, version 36 and higher, through the **Firefox Remote** debug configuration. Debugging applications running on external web servers in Firefox is not supported at all.

## JavaScript Debug-specific configuration settings

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
URL	<ul style="list-style-type: none"><li>– <b>Debugging JavaScript:</b> In this text box, specify the URL address of the HTML file that references the JavaScript to debug. For <b>local debugging</b>, type the URL in the format <code>http://localhost:&lt;built-in server port&gt;/&lt;project root&gt;</code>. The <b>built-in server port</b> (1024 or higher) is specified on the <a href="#">Debugger</a> page of the Settings dialog box.</li><li>– <b>Debugging a Dart web application:</b> In this text box, specify the URL address of the HTML file that references the Dart code to debug in the format: <code>http://localhost:&lt;built-in server port&gt;/&lt;project-name&gt;/&lt;relative path to the HTML file&gt;</code>. Make sure the port in this URL address is the same as the Built-in server port on the <a href="#">Debugger</a> page and the <a href="#">port from the Chrome extension settings</a>.</li></ul>
Browser	<p>From this drop down list, select the browser, where your application will be debugged.</p> <ul style="list-style-type: none"><li>– <b>Debugging JavaScript:</b> Chrome</li><li>– <b>Debugging a Dart web application:</b> If you choose Dartium which has a built-in Dart virtual machine, the Dart code is executed natively. If you choose Chrome, the Dart code is compiled into JavaScript through the <a href="#">dart2js</a> or <a href="#">dartdevc</a> tool. The tool is invoked automatically when you <a href="#">run or debug a Dart web application</a>.</li></ul> <p>Specify the URL address of the HTML file that references the Dart code to debug in the format: <code>http://localhost:&lt;built-in server port&gt;/&lt;project-name&gt;/&lt;relative path to the HTML file&gt;</code>. Make sure the port in this URL address is the same as the Built-in server port on the <a href="#">Debugger</a> page and the <a href="#">port from the Chrome extension settings</a>.</p>
Remote URLs of local files	<ul style="list-style-type: none"><li>– <b>Debugging JavaScript:</b> IntelliJ IDEA displays this area only when you create a permanent debug configuration manually. For automatically generated temporary configurations the area is not shown.</li><li>In this area, map the local files to be involved in debugging to the URL addresses of their copies on the server.<ul style="list-style-type: none"><li>– <b>File/Directory</b> - in this read-only field, select the desired local file or directory in the project tree.</li><li>– <b>Remote URL</b> - in this text box, type the absolute URL address of the corresponding file or folder on the server.</li></ul></li><li>These mappings are required only if the local folder structure under the project root differs from the folder structure on the server. If the structures are identical, IntelliJ IDEA itself "retrieves" the paths to local files by parsing the URL addresses of their copies on the server.</li><li>– <b>Debugging a Dart web application:</b> IntelliJ IDEA displays this area only when the port specified in the URL field is different from the port of the built-in Web server specified on the <a href="#">Debugger</a> page of the Settings dialog box.</li></ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	<b>Edit defaults</b>	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or	Use these buttons to move the selected configuration or folder up and down in the list.

Alt+Down

The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder

Use this button to [create a new folder](#) .  
If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members.  
If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate .xml file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once.  
Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass

to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration. For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  (Shift+Enter) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code>.</li></ul> Here is how you can specify a custom configuration directory and file name: <pre>-Djboss.server.config.dir=C:/jboss-eap-6.3/custom-configuration</pre> <pre>-Djboss.server.default.config=standalone-custom.xml</pre>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <b>Ctrl+F10</b> ) in the Run or Debug tool window. The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are</li></ul>

recompiled.

In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.

- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
Username	Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.
Password	The password of the user specified in the <a href="#">Username field</a> .
Operating mode	Select: <ul style="list-style-type: none"><li>- standalone to start JBoss as a standalone server. Port offset. If necessary, specify the port offset, i.e. the number by which all the server ports should be shifted. (The ports are specified by means of the <code>&lt;socket-binding&gt;</code> elements in the server configuration file <code>standalone.xml</code> .)</li></ul> <p>The specified offset is passed to the server as a VM option, e.g.</p> <pre>-Djboss.socket.binding.port-offset=100</pre> <ul style="list-style-type: none"><li>- domain to start the server as a managed domain. Server group. Select the server group to deploy your artifacts to. (The list items correspond to the <code>&lt;server-group&gt;</code> elements in the configuration file <code>domain.xml</code> . The server group doesn't matter if you don't deploy anything using this run configuration.)</li></ul> <p>When you select other-server-group , the following message may be shown in the lower part of the dialog: <i>Error: No single server is configured to start for server group 'other-server-group'</i> . If this is the case and you click Fix , the configuration file <code>host.xml</code> is modified. (The <code>auto-start</code> attribute of the first <code>&lt;server&gt;</code> element in the server group is changed from <code>false</code> to <code>true</code> .)</p>

## Server tab for a remote configuration

### ItemDescription

---

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <code>Shift+Enter</code> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath your Web application After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). The options are: <ul style="list-style-type: none"><li>- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li></ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
Management port	The native management interface port. (This port is defined in the <code>standalone.xml</code> configuration for a standalone server and in the <code>host.xml</code> configuration for a server within a managed domain.)

Operating mode	The server operating mode: standalone for a standalone server and domain for a managed domain. For the managed domain mode, specify the server group to deploy your artifacts to, e.g. <code>main-server-group</code> . The server group doesn't matter, if you don't deploy anything using this run configuration.
Username	Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.
Password	The password of the user specified in the <a href="#">Username field</a> .
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: <ul style="list-style-type: none"> <li>– Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host.</li> <li>– ftp. The <a href="#">File Transfer Protocol</a> or <a href="#">Secure FTP</a> is used.</li> <li>– Local or mounted folder. The staging environment is a local folder or is accessed as a <a href="#">mounted folder</a> .</li> </ul> <p>If the list is empty, you have to <a href="#">enable the Remote Hosts Access plugin</a> which supports the corresponding functionality.</p>
Host	If Same file system is selected for Type , the only available option for Host is also Same file system . In all other cases, the list contains the existing configurations of the selected <a href="#">type</a> . So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.  Select an existing configuration or create a new one.  To create a new configuration: <ol style="list-style-type: none"> <li>1. Click  to the right of the list.</li> <li>2. In the <a href="#">Deployment dialog</a> , click <a href="#">+</a> .</li> <li>3. In the Add Server dialog, specify the configuration name, select the type, and click OK .</li> <li>4. On the <a href="#">Connection tab</a> , specify the settings in the Upload/download project files section. The rest of the settings don't matter.</li> <li>5. Click OK in the Deployment dialog.</li> </ol>
Staging	When deploying to the remote host, the application artifact or artifacts are placed into a staging folder which should be accessible to JBoss Server. The settings in this section define the location of this staging folder. Note that if Same file system is selected for Type and Host , no settings in this section need to be specified.
Path from root	The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.
Mapped as	The absolute path to the staging folder in the local file system of the remote host.
Remote connection settings	The settings for accessing deployed applications.
Host	The fully qualified domain name or the IP address of the JBoss Server host. When the target server operates in the managed domain mode, this is the Domain Controller host.
Port	The server HTTP port.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:` .
- The folder that you are going to use for staging is `C:\shared\staging` .

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Staging/Path from root: `staging`
- Staging/Mapped as: `C:\shared\staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use [+](#) . For more information, see the table below.

### ItemDescription

-  Use this icon or shortcut to add an artifact or an external resource to the list.
  - To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
  - To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

For a Web Application Exploded artifact, the following message may be shown in the lower part of the dialog:

*Error: Artifact '<name>' has invalid extension.*

If this is the case, click Fix and add `.war` at the end of the output directory name.

---

 or 	Use this icon or shortcut to remove the selected artifacts and external resources from the list.
 or 	Use this icon or shortcut to move the selected item one line up in the list.
 or 	Use this icon or shortcut to move the selected item one line down in the list.
 or 	Use this icon or shortcut to configure the selected artifact. (The <a href="#">Artifacts page</a> of the <a href="#">Project Structure dialog</a> will open.)

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

---

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

---

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

---

 Run /	Use to switch between the settings for the run, debug and code coverage modes.
--	--

Startup script	<p>Specify the script to be used to start the server.</p> <p>Use default:</p> <ul style="list-style-type: none"> <li>If this checkbox is selected, the default script is used.</li> <li> in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).</li> <li>Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li> <li>If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value"</code> .</li> </ul>
Shutdown script	<p>Specify the script to be used to stop the server.</p> <p>Use default:</p> <ul style="list-style-type: none"> <li>If this checkbox is selected, the default script is used. (For certain JBoss versions, there is no default script and the server is stopped through its management API.)</li> <li> in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).</li> <li>Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li> <li>If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value"</code> .</li> </ul>
Pass environment variables	<p>To pass specific variables to the server environment, select this checkbox and specify the variables:</p> <ul style="list-style-type: none"> <li>To add a variable, click  and specify the variable name and value in the Name and Value fields respectively.</li> <li>To remove a variable from the list, select the variable and click  .</li> </ul>
Port	Use this field to change the debugger port.
Debugger Settings	Click this button to edit the debugger options on the <a href="#">Debugger page</a> of the <a href="#">Settings dialog</a> .

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

	<div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 5px; display: inline-block; margin-right: 5px;">Alt+Insert</div> <p>Click this icon to add a task to the list. Select the task to be added, for example:</p> <ul style="list-style-type: none"> <li>Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li> </ul>
---	---

- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

	<b>Alt+Delete</b>	Click this icon to remove the selected task from the list.
	<b>Enter</b>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<b>Alt+Up / Alt+Down</b>	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

	<b>Alt+Insert</b>	Create a run/debug configuration.
	<b>Alt+Delete</b>	Delete the selected run/debug configuration.
	<b>Ctrl+D</b>	Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
	<b>Alt+Up / Alt+Down</b>	Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders.</p> <p>To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click  .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .</p>

In this dialog box, create configurations for running [Jest](#) tests.

On this page:

- [Getting access to the Run/Debug Configuration: Jest dialog](#)
- [Jest-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Jest dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#).

## Jest-specific configuration settings

### ItemDescription

Configuration file	In this field, optionally specify the <code>jest.config</code> file to use: choose the relevant file from the drop-down list, or click  and choose it in the dialog that opens, or just type the path in the text box. If the field is empty, IntelliJ IDEA looks for a <code>package.json</code> file with a <code>jest</code> key. The search is performed in the file system upwards from the <b>working directory</b> . If no appropriate <code>package.json</code> file is found, then the <a href="#">Jest default configuration</a> is used.
Node interpreter	In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a> .  If you have <a href="#">appointed one of the installations as default</a> , the field displays the path to its executable file.
Jest package	In this field, specify the location of the <code>jest</code> , <code>react-scripts</code> , <code>react-script-ts</code> , <code>react-super-scripts</code> , or <code>react-awesome-scripts</code> package.
Working Directory	In this field, specify the <a href="#">working directory</a> of the application. All references in the starting Node.js application file, for example, <code>imports</code> , will be resolved relative to this folder, unless such references use full paths. By default, the field shows the <a href="#">project root folder</a> . To change this predefined setting, choose the desired folder from the drop-down list, or type the path manually, or click the Browse button  and select the location in the dialog box, that opens.
Jest options	In this text box, type the <a href="#">Jest CLI options</a> to be passed to <code>Jest</code> . For example, add a <code>--watch</code> flag to turn on the autotest-like runner. As a result, any test in the current run configuration restarts automatically on changing the related source code, without clicking the Rerun button  .
Environment variables	In this field, optionally specify the environment variables for executing commands.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members.

If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea/runConfigurations` folder if the run/debug configuration is shared, or in the `.idea/workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- **Run External tool.** Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- **Make.** Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- **Make, no error check.** The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- **Build Artifacts.** Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- **Run Another Configuration.** Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- **Run Ant target.** Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- **Run Grunt task.** Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- **Run Gulp task.** Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- **Run npm Script.** Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- **Compile TypeScript.** Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the **Check errors** checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the **Check errors** checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the **Check errors** checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- **Generate CoffeeScript Source Maps.** Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- **Run Maven Goal.** Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Jetty Server [run/debug configurations](#) let you deploy and debug your applications on [Jetty](#) . (The Jetty Integration [plugin](#) must be enabled.)

- [Name field and Share option](#)
- [Server tab for a local configuration](#)
- [Server tab for a remote configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab for a remote configuration](#)

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  (Shift+Enter) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li> <li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="quoted_value\"</code> .</li> </ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"> <li>– Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li> <li>– Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li> <li>– Redeploy. The application artifact is rebuilt and redeployed.</li> <li>– Restart server. The server is restarted. The application artifact is rebuilt and redeployed.</li> </ul> For packed artifacts, the available options are: <ul style="list-style-type: none"> <li>– Update classes. Changed classes are recompiled and redeployed. This option is not available in the debug</li> </ul>

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
JMX port	The server JMX port.
Active	Select the checkboxes to make the corresponding files active. For Jetty versions before 9, the list contains the server XML configuration files. For Jetty 9, the module <code>.mod</code> files are listed.  The selected files are passed as command-line arguments to <code>&lt;jetty_home&gt;\start.jar</code> which is used to start the server.
Path	The paths to the corresponding Jetty configuration or module files are shown (readonly). For the files located within the Jetty installation directory, the paths are relative to the installation directory. For all the rest of the configuration files, the absolute paths are shown.
	Initially, the list contains the files located in <code>&lt;jetty_home&gt;\etc</code> or <code>&lt;jetty_home&gt;\modules</code> . Use the following icons to manage the list:  <ul style="list-style-type: none"> <li> Click this icon to add a file to the list. In the <a href="#">dialog that opens</a> , select the necessary Jetty configuration or module file and click OK .</li> <li> Click this icon to remove the selected file from the list. Note that this operation does not delete the file physically.</li> <li> Click this icon to replace the selected file. In the <a href="#">dialog that opens</a> , select the replacement file and click OK .</li> <li> . Click the icon to move the selected file one line up or down in the list.</li> </ul>

## Server tab for a remote configuration

### ItemDescription

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> ) in the Run or Debug tool window). The options are: <ul style="list-style-type: none"> <li>- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li> <li>- Redeploy. The application artifact is rebuilt and redeployed.</li> </ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JMX Port	The server JMX port.
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: <ul style="list-style-type: none"> <li>- Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case</li> </ul>

- are deployed locally and, thus, don't need to be transferred to a remote host.
  - ftp. The [File Transfer Protocol](#) or [Secure FTP](#) is used.
  - Local or mounted folder. The staging environment is a local folder or is accessed as a [mounted folder](#).
- If the list is empty, you have to [enable the Remote Hosts Access plugin](#) which supports the corresponding functionality.

**Host** If Same file system is selected for Type, the only available option for Host is also Same file system. In all other cases, the list contains the existing configurations of the selected type. So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.

Select an existing configuration or create a new one.

To create a new configuration:

1. Click  to the right of the list.
2. In the [Deployment dialog](#), click .
3. In the Add Server dialog, specify the configuration name, select the type, and click OK.
4. On the [Connection tab](#), specify the settings in the Upload/download project files section. The rest of the settings don't matter.
5. Click OK in the Deployment dialog.

**contexts** Location of one of the following directories:

- For Jetty 9: `<jetty_home>\webapps`
- For Jetty versions before 9: `<jetty_home>\contexts`

(This is where IntelliJ IDEA generates the deployment descriptor XML file for the application artifact.)

**Local path or Path from root** If Same file system is selected for Type and Host, specify the absolute path. In all other cases, specify the path relative to the local or mounted folder, or the root of the (S)FTP host.

You can use  to select the folder in the Select Path or the Choose target path dialog.

**Staging** When deploying to the remote host, the application artifact or artifacts are placed into a staging folder which should be accessible to Jetty. The settings in this section define the location of this staging folder. Note that if Same file system is selected for Type and Host, no settings in this section need to be specified.

**Path from root** The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.

**Mapped as** The absolute path to the staging folder in the local file system of the remote host.

**Remote connection settings** The settings for accessing deployed applications. In Jetty run/debug configurations, these are used just to form the [starting URL](#).

**Host** The fully qualified domain name or the IP address of the Jetty host.

**Port** The server HTTP port.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:`.
- Jetty is installed in `C:\shared\jetty-distribution-9.2.7.v20150116`.
- The folder that you are going to use for staging is `C:\shared\staging`.

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- contexts/Path from root: `jetty-distribution-9.2.7.v20150116\webapps` (For Jetty 8 or earlier version, that would be something like `jetty-distribution-8.0.1.v20110908\contexts`.)
- Staging/Path from root: `staging`
- Staging/Mapped as: `C:\shared\staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup), use . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

 or Use this icon or shortcut to add an artifact or an external resource to the list.

-  – To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
-  – To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#).

 or Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 or **F4** Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

**Use custom context root** If you want to assign a particular [context root](#) to an artifact or external resource, select the artifact or the resource, select the checkbox and specify the desired context root in the field underneath the checkbox.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

<b>Is Active</b>	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
<b>Log File Entry</b>	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
<b>Skip Content</b>	Select this check box to have the previous content of the selected log skipped.
<b>Save console output to file</b>	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
<b>Show console when a message is printed to standard output stream</b>	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
<b>Show console when a message is printed to standard error stream</b>	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

<b>Choose code coverage runner</b>	Select the desired code coverage runner.
<b>Sampling</b>	Select this option to measure code coverage with minimal slow-down.
<b>Tracing</b>	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
<b>Track per test coverage</b>	Select this checkbox to detect lines covered by one test and all tests covering line.
<b>Packages and classes to record code coverage data</b>	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
<b>Enable coverage in test folders.</b>	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 <b>Run /</b>	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 <b>Debug</b>	

To run/debug remote server JVM... The command-line options for starting the server JVM. These are shown just for copying elsewhere.

Transport (and all that follows) The GUI for generating the remote debug command-line options shown in the area under [To run/debug...](#)

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>– Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>– Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page	<input type="checkbox"/>	Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window	<input type="checkbox"/>	If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.  To remove grouping, select a folder and click  .  See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .

This feature is only supported in the Ultimate edition.

Use this dialog to create or edit [run/debug configurations](#) for JSR45-compatible application servers.

Generally, you may want to use this type of run/debug configuration under the following conditions:

- The server you are going to work with supports [JSR-45](#).
- IntelliJ IDEA doesn't provide a dedicated plugin for integration with this server.

On this page:

- [Server tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab](#)

## Server tab

### ItemLocal/RemoteDescription

Application Server	Both	Select the server configuration to be used. If the run/debug configuration is intended for working with a remote server, the same server version should be configured locally and associated with the run/debug configuration.  Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
Start browser	Both	Select this checkbox to run the default Web browser to study your application output there.
With JavaScript debugger	Both	If this checkbox is selected, the Web browser is started with the JavaScript debugger enabled. JavaScript debugging is available for Firefox only. Note that when you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension will be installed.
Startup page	Both	In this field, specify the URL the browser should go to when started. In most typical cases, this URL will correspond to the root of your Web application or its starting page.
VM options	Local	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code>.</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code>.</li></ul>
On 'Update' action	Local	Select the action to be performed when the application is updated in the <a href="#">Run</a> or the <a href="#">Debug tool window</a> .
Show dialog	Local	Select this checkbox if you want to see the Update <application name> dialog every time you perform the Update action. The Update <application name> dialog is used to view and change the current update option (for example, Restart server ) prior to actually updating the application.
JSP's package	Both	Specify the Java package prefix to be used for jsp-to-servlet translation.
VM options variable	Local	If there is a variable which stores the command-line JVM options, you can specify the name of this variable in this field. In this way, you can pass the corresponding options to the server JVM at the server start.
Port	Both	Specify the HTTP server port.
Use JSP's line mapping model specific for WebSphere 5.1	Both	If the run/debug configuration is intended for working with WebSphere Server 5.1, select this checkbox to be able to debug your JSPs. (To be able to debug JSPs, it's necessary to maintain relationships between the lines of the source files and the corresponding positions in the compiled code. All the servers except WebSphere 5.1 form such relationships similarly.)
Host	Remote	The DNS name or the IP address of the server host (for example, <code>localhost</code> , <code>127.0.0.1</code> , etc.).

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li></ul>

- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.  
If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

	Select this check box to have the previous content of the selected log skipped.
	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

	Select the desired code coverage runner.
	Select this option to measure code coverage with minimal slow-down.
	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
	Select this checkbox to detect lines covered by one test and all tests covering line.
	<p>If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.</p> <p>To remove the classes or packages from the list, select the corresponding list items and click  .</p>
	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab

### ItemLocal/RemoteDescription

	Both	Select Run or Debug to show settings either for the run or the debug mode.
		
	Local	Select Run with Coverage to show settings for run with coverage mode.
	Local	<p>Specify the script to be used to start the server. If necessary, you can also specify the script parameters and the options to be passed to the server JVM. You can provide all the necessary information right in the field, by typing. As an alternative:</p> <ul style="list-style-type: none"> <li>– To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>– To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog. When specifying the parameters and options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg Or "some arg"</code> .</li> <li>– If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li> </ul> </li> </ul>
	Local	<p>Specify the script to be used to stop the server. If necessary, you can also specify the script parameters and the options to be passed to the server JVM. You can provide all the necessary information right in the field, by typing. As an alternative:</p> <ul style="list-style-type: none"> <li>– To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>– To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog. When specifying the parameters and options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg or "some arg"</code> .</li> </ul> </li> </ul>

- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `Dmy.prop=\"quoted_value\"`.

Pass environment variables	Local	To pass specific variables to the server environment, select this checkbox and specify the variables: <ul style="list-style-type: none"> <li>- To add a variable, click <b>+</b> and specify the variable name and value in the Name and Value fields respectively.</li> <li>- To remove a variable from the list, select the variable and click <b>-</b>.</li> </ul>
Port	Local	Use this field to change the debugger port (if necessary).
Debugger Settings	Local	Click this button to edit the debugger options on the <a href="#">Debugger page</a> of the <a href="#">Settings dialog</a> .
Transport	Remote	Specify the "transport" settings for the connection with the debugger. In technical terms, these are the parameters for the <code>-Xrunjdpw</code> command-line option: <ul style="list-style-type: none"> <li>- Socket. Specify the debugger port in the Port field. The combination of these two settings translates into <pre>-Xrunjdpw:transport=dt_socket,address=&lt;port&gt;,suspend=n,server=y</pre> </li> <li>- Shared memory. Specify the shared memory address in the corresponding field. The combination of these two settings translates into <pre>-Xrunjdpw:transport=dt_shmem,address=&lt;address&gt;,suspend=n,server=y</pre> </li> </ul> <p>Note that as you change the transport settings, what follows <code>transport=</code> within <code>-Xrunjdpw</code> in the area above also changes. In this way you control the corresponding command-line debugger parameters which you cannot edit directly.</p>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

<b>+</b>	<b>Alt+Insert</b>	Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a>.</li> <li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li> <li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a>.</li> <li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a>.</li> <li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a>.</li> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> </ul>
<b>-</b>	<b>Alt+Delete</b>	Click this icon to remove the selected task from the list.
	<b>Enter</b>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<b>Alt+Up</b> / <b>Alt+Down</b>	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

<b>+</b>	<b>Alt+Insert</b>	Create a run/debug configuration.
<b>-</b>	<b>Alt+Delete</b>	Delete the selected run/debug configuration.

---

		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders.</p> <p>To create a folder, select the configurations to be grouped and click . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .</p>

---

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Mode	Click one of the radio buttons to define the scope of features: <ul style="list-style-type: none"><li>– All features in a folder : Click this radio button, if you want to run all features in a directory.</li><li>– Feature file : Click this radio button, if you want to run the specified feature only.</li></ul>
Feature folder	Specify the fully qualified path to the directory that contains the desired features, or click  and select the features directory in the dialog that opens. This field is only available, when the All features in folder option is selected.
Feature file	Specify the name of the script to be executed.  This field is only available, when the Feature file option is selected.
Element name filter	IntelliJ IDEA will execute the feature elements with the names that contain matching substrings ( <code>-n</code> , <code>--name NAME</code> ).
Tags filter	Specify the tags to be considered on running tests ( <code>-t</code> , <code>--tags TAGS</code> ).
Runner options	Enter runner options.  <b>Note</b> It is important to note that step definitions that reside outside the <code>Features</code> directory, can be skipped by IntelliJ IDEA, and the tests will fail to run. Thus, if you want to make use of the step definitions located elsewhere, you have to specify the required directory with the step definition files, or individual step definition files. To do that, add <code>-r &lt;file or directory name&gt;</code> to the Runner options field.  If the path to a step definition file or directory is relative, it is relative to the Working directory defined in this run/debug configuration.
VM options	In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as <code>-mx</code> , <code>-verbose</code> , etc. If necessary, click  and type the desired string in the VM Options dialog.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="quoted_value"</code> .</li></ul> The <code>-classpath</code> option specified in this field overrides the classpath of the module.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box. Formerly, the environment variable <code>RAILS_ENV</code> has been implicitly set to <code>cucumber</code> , if the user has not explicitly set any other value of this variable.  Now this setting is not used any more. If defining the environment variable <code>RAILS_ENV</code> is required, the Cucumber default run/debug configuration should be edited.
Use classpath of module	Select the module whose classpath should be used to run the application.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

**Packages and classes to record code coverage data** Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

**Do not use the optimized C runtime** Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

**Enable coverage in test folders.** If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

**Is Active** Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

**Log File Entry** The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.

If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

**Skip Content** Select this check box to have the previous content of the selected log skipped.

**Save console output to file** Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

**Show console when a message is printed to standard output stream** Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

**Show console when a message is printed to standard error stream** Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

 Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

 Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

 Click this button to remove the selected log entry from the list.

 Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

  `Alt+Insert` Click this button to add a new configuration to the list.

  `Alt+Delete` Click this button to remove the selected configuration from the list.

  `Ctrl+D` Click this button to create a copy of the selected configuration.

	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"> <li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>– Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>grunt-cli</code> package.</li> </ul>
---	---	---

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create a configuration to be used for running JavaScript unit tests in the browser against a JSTestDriver server. Configurations of this type enable running unit tests based on the [JSTestDriver Assertion](#) , [Jasmine](#) , and [QUnit](#) frameworks.

The dialog box is available when the JSTestDriver plugin is activated. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

On this page:

- [Configuration tab](#)
  - [Test](#)
  - [Server](#)
- [Debug tab](#)
- [Coverage tab](#)
- [Toolbar](#)
- [Common options](#)

## Configuration tab

In this tab, specify the tests to run, the configuration files to use, and the server to run the tests against.

### Test

In this area, tell IntelliJ IDEA where to find the tests to execute and how to get [test runner configuration files](#) that define which test files to load and in which order. The main approaches are:

- Specify the location of one or several previously created configuration files.
- Point at the target test file, test case, or test method, and then specify the location of the corresponding configuration file.

The way to find tests and configuration files is defined in the Test drop-down list. This choice determines the set of other controls in the area.

Item	Description	Available for
Test	In this drop-down list, specify how IntelliJ IDEA will get test runner configuration files. <ul style="list-style-type: none"><li>- All configuration files in directory: select this option to use all the test runner configuration files in a specific folder.</li><li>- Configuration file: select this option to use a specific test runner configuration file.</li><li>- JavaScript test file: select this option to have tests from a specific file executed using one of the previously defined configuration files.</li><li>- Case: select this option to run a specific test case using one of the previously defined configuration files.</li><li>- Method: select this option to run a specific test method using one of the previously defined configuration files.</li></ul>	
Directory	In this text box, specify the folder to look for test runner configuration files in. Type the path manually or click the Browse button  and select the required folder in the dialog box, that opens.	All configuration files in directory
Matched configuration files	This read-only field shows a list of all the <code>*jstd</code> and <code>JSTestDriver.conf</code> test runner configuration files detected in the <a href="#">specified folder</a> .	All configuration files in directory
Configuration file	In this text box, specify the test runner configuration file to use. Type the path manually or click the Browse button  and select the required file in the dialog box that opens.	Configuration file
JS test file	In this text box, specify the JavaScript files with tests to be executed. Type the path manually or click the Browse button  and select the required file in the dialog box, that opens.	JavaScript test file Case Method
Case	In this text box, type the name of the target case from the <a href="#">specified JavaScript file</a> .	Case Method
Method	In this text box, type the name of the target method from the <a href="#">specified test case</a> within the <a href="#">specified JavaScript file</a> .	Method

### Server

In this area, appoint the test server to run tests against.

#### ItemDescription

At address Choose this option to have the test execution handles by a remote test server. In the text box, specify the URL

address to access the server through.

Running in IDE	Choose this option to have test execution handles through the JSTestDriver server that comes bundled with IntelliJ IDEA and can be launched from it.
Test Connection	Click this button to check that the specified test server is accessible. The server must be running. Start the server from IntelliJ IDEA or manually, according to the server-specific instructions.

## Debug tab

In this tab, appoint the browser to debug the unit test in when two or more browsers are captured simultaneously.

### ItemDescription

Debug	From this drop-down list, choose the browser to debug the specified tests in when two browsers are captured at a time. The available options are: <ul style="list-style-type: none"><li>- Chrome</li><li>- Firefox</li></ul>
-------	--

## Coverage tab

In this tab, specify the files that you do not want to be involved in coverage analysis.

### ItemDescription

Exclude file path	In this area, create a list of files to be skipped during coverage analysis. <ul style="list-style-type: none"><li>- To add an item to the list, click the Add button  and choose the required file in the <a href="#">dialog that opens</a> .</li><li>- To delete a file from the list so coverage is measured for it, select the file and click the Remove button  .</li></ul>
-------------------	--

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription  
shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in

---

		the dialog that opens. Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

---

JUnit run/debug configurations define how unit tests that are based on the JUnit testing framework should be run.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

It also contains a set of [options that are common for all run/debug configurations](#) and a [toolbar](#) that lets you manage your configurations.

**Tip** You can use `Ctrl+Space` to let IntelliJ IDEA help you fill in the fields in this dialog. (In the editor, `Ctrl+Space` is used for [code completion](#).)

## Configuration tab

### ItemDescription

Test kind	From this drop-down list, select the scope for your tests and fill in the fields depending on your selection.
All in package	Select this option to run all unit tests in the specified package. Fill in the following fields: <hr/> <b>Package</b> Specify package name <hr/> <b>Search for tests</b> Select where in your project IntelliJ IDEA shall look for test classes related to the current package: <ul style="list-style-type: none"><li>- In whole project : IntelliJ IDEA will look for test classes in all project modules</li><li>- In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li><li>- Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li></ul>
All in directory	Select this option to run all unit tests in the specified directory. Fill in the following field: <hr/> <b>Directory</b> Specify the directory where you want to run the tests. It will act as the root directory for all relative input and output paths.
Pattern	Select this option to run a set of test classes. This set may include classes located in the same or different directories, packages or modules. Fill in the following fields: <hr/> <b>Pattern</b> Specify the required classes. Each class in this field must be represented by its fully qualified name. Class names must be separated with <code>  </code> . You can type class names manually, or click <code>+</code> on the right (or press <code>Shift+Enter</code> ) and search for classes you want to add in the dialog that opens. You can also create a suite test, i.e. a bundle of several test classes that will be run together. To create a suite test class, click <code>+</code> on the right and type the test classes you want to be run as a suite in the Configure suit tests dialog that opens. As a result, a new class will be created with the <code>@suite</code> annotation. <hr/> <b>Method</b> Specify the method to be launched (passed to the JRE). Type method name, or click <code>...</code> and select the desired method in the dialog that opens. <hr/> <b>Search for tests</b> Select where in your project IntelliJ IDEA shall look for test classes related to the current package: <ul style="list-style-type: none"><li>- In whole project : IntelliJ IDEA will look for test classes in all project modules</li><li>- In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li><li>- Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li></ul>
Class	Select this option to run all tests in a class. Fill in the following field: <hr/> <b>Class</b> Specify the fully qualified name of the class to be launched (passed to the JRE). Type the class name or click <code>...</code> and select the desired class in the dialog that opens.
Method	Select this option to run an individual test method. Fill in the following fields: <hr/> <b>Class</b> Specify the fully qualified name of the class to be launched (passed to the JRE). Type the class name or click <code>...</code> and select the desired class in the dialog that opens. <hr/> <b>Method</b> Specify the method to be launched (passed to the JRE). Type method name, or click <code>...</code> and select the desired method in the dialog that opens.
Category	Select this option if you only want to run test classes and test methods that are annotated either with the category given with the <code>@IncludeCategory</code> annotation, or a subtype of this category. <a href="#">Learn more about JUnit categories</a> . Fill in the following fields: <hr/> <b>Category</b> Specify the desired category. Type category name, or click <code>...</code> and select the desired category in the dialog that opens. <hr/> <b>Search for tests</b> Select where in your project IntelliJ IDEA shall look for test classes related to the current package: <ul style="list-style-type: none"><li>- In whole project : IntelliJ IDEA will look for test classes in all project modules</li><li>- In single module : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field</li><li>- Across multiple dependencies : IntelliJ IDEA will look for test classes only in the module selected in the Use classpath of module field, and in the modules that depend on it</li></ul>

Fork mode	This option controls how many Java VMs will be created if you want to fork some tests. Select method or class to create a separate virtual machine for each method or class respectively. The available options in this drop-down list depend on the <a href="#">Test kind</a> setting.
Repeat	If you want to repeatedly run a test, select the threshold from this drop-down list. You can select to run your test once, n times (in this case specify the number of times in the field on the right), until the test fails, or until it is stopped.
VM options	If necessary, specify the string to be passed to the VM. This string may contain the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"> <li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li> <li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li> <li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code>.</li> </ul> <p>If there is not enough space, you can click  and enter the string in the dialog that opens.</p> <p>The <code>-classpath</code> option specified in this field overrides the classpath of the module.</p>
Program arguments	In this field, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the required arguments in the dialog that opens. Use the same rules as for specifying the <a href="#">VM options</a> .
Working directory	Specify the directory that will act as the current directory when running the test. It will act as the root directory for all relative input and output paths. By default, the directory where the project file resides, is used as a working directory. Type directory name, or click  and select the desired directory in the dialog that opens. You can also click  to switch between directories.
Environment variables	Click  to open the Environment Variables dialog box where you can create variables and specify their values.
Use classpath of module	Select the module whose classpath should be used to run the tests.
JRE	Specify the JRE to be used. Select the JRE from the list, or click  and select the installation folder of the required JRE in the dialog that opens.
Shorten command line	Select a method that will be used to shorten the command line if the classpath gets too long or you have many VM arguments that exceed your OS command line length limitation: <ul style="list-style-type: none"> <li>– none : IntelliJ IDEA will not shorten a long classpath. If the command line exceeds the OS limitation, IntelliJ IDEA will be unable to run your application and will display a message suggesting you to specify the shortening method.</li> <li>– JAR manifest : IntelliJ IDEA will pass a long classpath via a temporary <code>classpath.jar</code>. The original classpath is defined in the <code>manifest</code> file as a <code>class-path</code> attribute in <code>classpath.jar</code>. Note that you will be able to preview the full command line if it was shortened using this method, not just the classpath of the temporary <code>classpath.jar</code>.</li> <li>– classpath.file : IntelliJ IDEA will write a long classpath into a text file.</li> <li>– User-local default : this legacy option is set automatically for projects created before IntelliJ IDEA version 2017.3. IntelliJ IDEA will configure this setting depending on the properties set in the <code>ide/workspace.xml</code> and <code>idea.config.path/options/options.xml</code> files.</li> </ul>

**Note** This setting is shared if you select to share your run/debug configuration, so the same method will be applied for your team members irrespective of their operating system.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View, taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
Packages and	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and

classes to record packages from the list by selecting them in the list and clicking the  button.

code coverage data

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders. If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.
		Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.
 

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.
 

See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.
 

This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.
 

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.
 

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.
 

Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript

compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for running and debugging JavaScript unit tests using the Karma test runner .

On this page:

## Getting access to the Run/Debug Configuration: Karma dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#) .
3. Using the [Node Package Manager](#) , install the [Karma test runner](#) as described in [Karma](#) .
4. Make sure the [Karma](#) plugin is activated. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

## Karma-specific configuration settings

### ItemDescription

Name	In this text box, specify the name of the run/debug configuration.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Node.js interpreter	In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a> .  If you have <a href="#">appointed one of the installations as default</a> , the field displays the path to its executable file.
Karma Node.js package	In this field, specify the Karma installation home <code>/npm/node_modules/karma</code> . If you installed <a href="#">Karma</a> regularly through the <a href="#">Node Package Manager</a> , IntelliJ IDEA detects the Karma installation home itself. Alternatively, type the path to executable file manually, or click the <a href="#">Browse</a> button  and select the location in the dialog box, that opens.
Configuration file	In this field, specify the location of the <a href="#">Karma configuration file</a> . Normally, the file has the extensions <code>.conf.js</code>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Select this option to have the</li> </ul>
---	------------	--

source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

The Kotlin run/debug configuration enables you running or debugging Kotlin applications.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

**Main class** In this text box, specify the fully qualified name of the class to be executed (passed to the JRE). Type the class name manually or click the Browse button  to open the Choose Main Class dialog box, where you can find the desired class by name or search through the project.

**VM options** In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as `-mx` , `-verbose` , etc.  
If necessary, click  and type the desired string in the VM Options dialog.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value\"` .

The `-classpath` option specified in this field overrides the classpath of the module.

**Program arguments** In this text box, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the desired arguments in the Program Parameters dialog box. Use the same rules as for specifying the [VM options](#) .

**Working directory** In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the [dialog that opens](#) . Click this  icon to view the list of available [path variables](#) that you can use as a path to your working directory.

**Note** The list of the path variables may vary depending on the enabled plugins.

**Environment variables** Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.  
Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.

**Use classpath of module** Select the module whose classpath should be used to run the application.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner.  
By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

**Packages and classes to record code coverage data** Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime  Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders  If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.
 

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.
 

See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.
 

This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.
 

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.
 

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.
 

Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the

Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

The **Kotlin-JavaScript** run/debug configuration enables you running or debugging Kotlin-JavaScript applications in the Ultimate edition of IntelliJ IDEA.

## Kotlin-JavaScript options

### ItemDescription

Generated JavaScript file directory	In this text box, specify the directory, where the generated JavaScript file will be placed. You can type the path manually, or use the browse button  to locate the directory in your file system.
Open in browser after translation	Select this checkbox to have the generated file opened in the selected browser. The following two fields become enabled only when this checkbox is selected.  <b>HTML</b> In this text box, specify the corresponding HTML file. You can type the file path manually, or use the file browse button  to locate the desired HTML file in your file system.  <b>Browser</b> Select the desired browser from the drop-down list.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: – Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see
---	---	---

[Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option

is enabled by default.

The **Kotlin script** run/debug configuration enables you running or debugging Kotlin scripts.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Script file	Specify here the path to a <code>*.kts</code> file to be launched.
VM options	<p>In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as <code>-mx</code>, <code>-verbose</code>, etc.</p> <p>If necessary, click  and type the desired string in the VM Options dialog.</p> <p>When specifying the options, follow these rules:</p> <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code>.</li></ul> <p>The <code>-classpath</code> option specified in this field overrides the classpath of the module.</p>
Program arguments	<p>In this text box, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the desired arguments in the Program Parameters dialog box.</p> <p>Use the same rules as for specifying the <a href="#">VM options</a>.</p>
Working directory	<p>In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the <a href="#">dialog that opens</a>.</p> <p>Click this  icon to view the list of available <a href="#">path variables</a> that you can use as a path to your working directory.</p> <div style="background-color: #ffff00; padding: 5px;"><b>Note</b> The list of the path variables may vary depending on the enabled plugins.</div>
Environment variables	<p>Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.</p> <p>Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.</p>
Use alternative JRE	Select the check box, if you want to specify an alternative JRE here; select the required JRE from the drop-down list, or click  and choose the required JRE from the file chooser dialog.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	<p>Select the desired code coverage runner.</p> <p>By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.</p>
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	<p>Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.</p> <div style="background-color: #ffff00; padding: 5px;"><b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.</div> <p>Refer to the section <a href="#">Viewing Code Coverage Results</a>.</p>
Merge data with previous results	<p>When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View, taking into account the statistics of each time you have run the configuration.</p> <div style="background-color: #ffff00; padding: 5px;"><b>Tip</b> Finally, the line is considered <i>covered</i> if it is covered at least once.</div>
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
Use bundled coverage.py	If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.
ItemKeyboardDescription shortcut	

		Click this icon to add a task to the list. Select the task to be added: – Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application
---	---	---

or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Use this dialog box to create a run/debug configuration for Lettuce tests .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

**Feature files or folders** In this text field, type the fully-qualified names of the feature files or directories which contain feature files.  
Multiple names should be delimited with | .  
Use the browse button to locate the desired paths in the file system.

**Params** In this text field, type the Lettuce-specific parameters to be passed to the tests. IntelliJ IDEA provides the possibility to pass parameters to the test runner.  
In particular, the Behave parameters are described in the [Tag expressions](#) section of the Behave documentation.

**Scenario** Type the name of the scenario to be executed. If this field is left blank, all the available scenarios in the specified feature files will be executed.

### Environment

**Project** Click this drop-down list to select one of the projects, [opened in the same IntelliJ IDEA window](#) , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.

**Environment variable** This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.  
To fill in the list, click the browse button, or press `Shift+Enter` and specify the desired set of environment variables in the Environment Variables dialog box.  
To create a new variable, click `+` , and type the desired name and value.

### Python Interpreter

**Interpreter options** In this field, specify the string to be passed to the interpreter. If necessary, click `⌨` , and type the string in the editor.

**Working directory** Specify a directory to be used by the running task.  
– When a default run/debug configuration is created by the keyboard shortcut `Ctrl+Shift+F10` , or by choosing `Run` on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.  
– When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

**Path mappings** This field appears, if a remote interpreter has been selected in the field Python interpreter .

Click the browse button `⌨` to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use `+`/`-` buttons to create new mappings, or delete the selected ones.

**Add content roots to PYTHONPATH** Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

**Add source roots to PYTHONPATH** Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

### Docker container settings

**Warning:** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note:** Speaking about the correspondence of settings with some options (`--net` , `--link` , etc.), note that these options come from [Docker command line arguments](#) .

Click `⌨` to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"` , which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net` .
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its name or id .

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all` .
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- Environment variables : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

---

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

---

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription  
shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.

Note that **code completion** is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This run/debug configuration is used to launch the Maven projects. The dialog box contains the following tabs:

- [Parameters tab](#)
- [General tab](#)
- [Runner tab](#)

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Name In this text box, specify the name of the current run/debug configuration.

## Parameters tab

#### ItemDescription

Working directory Specify the path to the Maven project file `pom.xml` .

Command line Specify the Maven goals and options separated with space.

Profiles Specify the profiles to be used separated with space.

Resolve We recommend that you use this checkbox if you have dependent modules in your project.

Workspace Artifacts

By default, this checkbox is not selected. In this case, classes of dependent modules are searched in `.jar` files in a Maven local repository. If you select this checkbox, the classes of the dependent modules will be searched in the module compilation output. In this case, each time you make changes to the dependent module, you don't need to deploy them into a local repository.

## General

#### ItemDescription

Work offline If this option is checked, Maven works in the offline mode and uses only those resources that are available locally. This option corresponds to the `--offline` command line option.

Use plugin registry Check this option to enable referring to the Maven Plugin Registry. This option corresponds to the `--no-plugin-registry` command line option.

Execute goals recursively If this option is cleared, the build does not recur into the nested projects. Clearing this option equals to `--non-recursive` command line option.

Print exception stack traces If this option is checked, exception stack traces are generated. This option corresponds to the `--errors` command line option.

Always update snapshots Select this checkbox to always update snapshot dependencies.

Output level Select the desired level of the output log, which allows plugins to create messages at levels of `debug` , `info` , `warn` , and `error` , or disable output log.

Checksum policy Select the desired level of checksum matching while downloading artifacts. You can opt to fails downloading, when checksums do not match ( `--strict-checksums` ), or issue a warning ( `--lax-checksums` ).

Multiproject build fail policy Specify how to treat a failure in a multiproject build. You can choose to:

- Fail the build at the very first failure, which corresponds to the command line option `--fail-fast` .
- Fail the build at the end, which corresponds to the command line option `--fail-at-end` .
- Ignore failures, which corresponds to the command line option `--fail-never` .

Plugin update policy Select plugin update policy from the drop-down list. You can opt to:

- Check for updates, which corresponds to the command line option `--check-plugin-updates` .
- Suppress checking for updates, which corresponds to the command line option `--no-plugin-updates` .

Threads (-T option) Use this field to set the `-T` option for parallel builds. This option is available for Maven 3 and later versions. For more information, see [parallel builds in Maven 3](#) feature.

Maven home directory Use this drop-down list to select a bundled Maven version that is available (for Maven2, version 2.2.1 and for Maven3, version 3.0.5) or the result of resolved system variables such as `MAVEN_HOME` or `MAVEN2_HOME` . You can also specify your own Maven version that is installed on your machine. You can click `...` and select the necessary directory in the [dialog that opens](#) .

User settings file Specify the file that contains user-specific configuration for Maven in the text field. If you need to specify another file, check the Override option, click the ellipsis button and select the desired file in the Select Maven Settings File dialog.

Local repository By default, the field shows the path to the local directory under the user home that stores the downloads and contains the temporary build artifacts that you have not yet released. If you need to specify another directory, check the Override option, click the ellipsis button and select the desired path in the Select Maven Local Repository dialog.

## Runner tab

## ItemDescription

VM Options	<p>Specify the string passed to the VM for launching the Maven project.</p> <p>When specifying the options, follow these rules:</p> <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\\"quoted_value\"</code> .</li></ul>
JRE	Select JRE from the drop-down list.
Skip tests	If this option is checked, the tests will be skipped when running or debugging the Maven project.
Environment variables	Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values.
Properties	Specify the properties and their values to be passed to Maven.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

## ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	<p>The read-only fields in this column list the log files to show. The list can contain:</p> <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	<p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	<p>Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.</p> <p><b>ItemKeyboardDescription shortcut</b></p> <p>  Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. <ul style="list-style-type: none"> <li>If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> </ul> </li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. <ul style="list-style-type: none"> <li>See also, <a href="#">Working with Artifacts</a>.</li> </ul> </li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. <ul style="list-style-type: none"> <li>This option is available only if you have already at least one run/debug configuration in the current project.</li> </ul> </li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a>.</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. <ul style="list-style-type: none"> <li>Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>grunt-cli</code> package.</li> </ul> </li> <li>- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the <code>Gulpfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. <ul style="list-style-type: none"> <li>Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>gulp</code> package.</li> </ul> </li> <li>- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the <code>package.json</code> file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. <ul style="list-style-type: none"> <li>Specify the location of the Node.js interpreter and the parameters to pass to it.</li> </ul> </li> <li>- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected: <ul style="list-style-type: none"> <li>- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.</li> </ul> </li> </ul>

- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to create configurations for running and debugging **Meteor** applications.

The dialog box is available when the **Meteor** plugin is enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

On this page:

- [Configuration tab](#)
- [Browser / Live Edit tab](#)
- [Toolbar](#)
- [Common options](#)

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Meteor Executable	In this field, specify the location of the <b>Meteor</b> executable file (see <a href="#">Installing Meteor</a> ).
Program Arguments	In this field, specify the command line additional parameters to be passed to the executable file on start up, if applicable. These can be, for example, <code>--dev</code> , <code>--test</code> , or <code>--prod</code> to indicate the environment in which the application is running ( <code>development</code> , <code>test</code> , or <code>production</code> environments) so different resources are loaded on start up.
Working Directory	<p>In this field, specify the folder under which the application files to run are stored. This folder must have a <code>.meteor</code> subfolder in the root so IntelliJ IDEA recognizes your application as a <b>Meteor project</b>. By default, the field shows the path to the IntelliJ IDEA project root.</p> <p>Technically, several Meteor projects that implement different applications can be combined within one single IntelliJ IDEA project. To run and debug these applications independently, create a separate run configuration for each of them with the relevant working directory. To avoid port conflicts, these run configurations should use different ports. In the Program Arguments field, specify a separate port for each run configuration in the format <code>--port=&lt;port_number&gt;</code>.</p>
Environment Variables	In this field, specify the <a href="#">environment variables</a> for the <b>Meteor</b> executable file, if applicable.

## Browser / Live Edit tab

In this tab, configure the behaviour of the browser and enable debugging the client-side code of the application. This functionality is provided through a `JavaScript Debug` run configuration, so technically, IntelliJ IDEA creates separate run configurations for the server-side and the client-side code, but you specify all your settings in one dedicated **Meteor** run configuration.

### ItemDescription

Open browser	In the text box in this area, specify the URL address to open the application at. If you select the After Launch check box, the browser will open this page automatically after the application starts. Alternatively you can view the same result by opening the page with this URL address in the browser of your choice manually.
After launch	<p>Select this check box Choose the browser to use from the drop-down list next to the After launch checkbox.</p> <ul style="list-style-type: none"><li>– To use the system default browser, choose Default .</li><li>– To use a custom browser, choose it from the list. Note that <b>Live Edit</b> is fully supported only in Chrome.</li><li>– To configure browsers, click the Browse button  and adjust the settings in the Web Browsers dialog box that opens. For more information, see <a href="#">Configuring Browsers</a>.</li></ul>
with JavaScript debugger	Select this check box to enable debugging the client-side code in the selected browser.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
		Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

 **Move into new folder / Create new folder** Use this button to [create a new folder](#) . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

 **Sort configurations** Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members. If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate .xml file in the `.idea/runConfigurations` folder if the run/debug configuration is shared, or in the `.idea/workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments

to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for running and debugging JavaScript unit tests using the Mocha test framework .

On this page:

- [Getting access to the Run/Debug Configuration: Mocha dialog](#)
- [Mocha-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Mocha dialog

1. Install and enable the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#) .
3. Using the [Node Package Manager](#) , install the [Mocha test framework](#) as described in [Mocha](#) .

## Mocha-specific configuration settings

### ItemDescription

**Node.js interpreter** In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in [Configuring Node.js Interpreters](#) .

If you have [appointed one of the installations as default](#) , the field displays the path to its executable file.

**Node options** In this text box, type the Node.js-specific command line options to be passed to the Node.js executable file. See [Node Parameters](#) for details.

**Working directory** In this field, specify the working directory of the application. By default, the Working directory field shows the project root folder. To change this predefined setting, specify the path to the desired folder or choose a previously used folder from the list.

**Environment variables** In this field, specify the [environment variables](#) for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:

- To define a new variable, click the Add toolbar button  and specify the variable name and value.
- To discard a variable definition, select it in the list and click the Delete toolbar button  .
- Click OK , when ready

The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:

- `NODE_PATH` : A  -separated list of directories prefixed to the module search path.
- `NODE_MODULE_CONTEXTS` : Set to 1 to load modules in their own global contexts.
- `NODE_DISABLE_COLORS` : Set to 1 to disable colors in the REPL.

**Mocha package** In this field, specify the Mocha installation home `/npm/node_modules/mocha` . If you installed [Mocha](#) regularly through the [Node Package Manager](#) , IntelliJ IDEA detects the Mocha installation home itself. Alternatively, type the path to executable file manually, or click the Browse button  and select the location in the dialog box, that opens.

**User interface** From this drop-down list, choose the [interface](#) according to which the tests in the `test` folder are written. IntelliJ IDEA will recognize only tests that comply with the chosen [interface](#) . If during test execution IntelliJ IDEA runs against a test of another [interface](#) , the test session will be canceled with an error. This means that all the tests in the specified `test` folder must be written according to the same [interface](#) and this [interface](#) must be chosen from the drop-down list.

**Extra Mocha options** In this field, specify additional [Mocha command line options](#) . For example, add a `--watch` flag to turn on the [autotest-like runner](#) . As a result, any test in the current run configuration restarts automatically on changing the related source code, without clicking the Rerun button  .

**Tests** In this area, specify the tests to be executed. The available options are:

- All in directory: choose this option to run all the tests from files stored in a folder. In the Test directory field, specify the folder with the tests. To have IntelliJ IDEA look for tests in the subfolders under the specified directory, select the Include subdirectories checkbox.
- File pattern: choose this option to have IntelliJ IDEA look for tests in all the files with the names that match a certain mask and specify the mask in the Test file pattern field.
- Test file: choose this option to run only the tests from one file and specify the path to this file in the Test file field.
- Suite: choose this option to run individual suites from a test file. In the Test file field, specify the file where the required suites are defined. Click the Suite name field and configure a list of suites to run. To add a suite to the list, click  and type the name of the required suite. To remove a suite, select it in the list and click  .
- Test: choose this option to run individual tests from a test file. In the Test file field, specify the file where the required tests are defined. Click the Test name field and configure a list of tests to run. To add a test to the list, click  and type the name of the required test. To remove a test, select it in the list and click  .

|---|---|---|
|  |  | Click this button to add a new configuration to the list.             |
|  |  | Click this button to remove the selected configuration from the list. |

	<b>Ctrl+D</b>	Click this button to create a copy of the selected configuration.
	<b>Edit defaults</b>	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	<b>Alt+Up</b> or <b>Alt+Down</b>	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	<b>Move into new folder / Create new folder</b>	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	<b>Sort configurations</b>	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

<b>Name</b>	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
<b>Defaults</b>	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
<b>Share</b>	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
<b>Single instance only</b>	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
<b>Before launch</b>	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

	<b>Alt+Insert</b>	<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass</li> </ul>
---	-------------------	---

to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Use this dialog to create or edit [MXUnit run/debug configurations](#) which let you run or debug your MXUnit tests.

Click [here](#) for the description of the options that are common for all run/debug configurations.

#### ItemDescription

Test	<p>Select the test scope and specify the associated settings:</p> <ul style="list-style-type: none"><li>– Directory. Select this option to run all tests in a certain directory. Specify the qualified directory name in the File field respectively. Alternatively, click  ( <code>Shift+Enter</code> ) and select the desired file in the Select Path dialog.</li><li>– Method. Select this option to run a test method. Specify the fully qualified name of the test file and the method name in the File and Method fields respectively. Use  ( <code>Shift+Enter</code> ) to select the desired file and method in the Select Path and the Choose Test Method dialogs.</li><li>– Component. Select this option to run a test for the specific component. Specify the fully qualified name of the test file in the File field respectively. Alternatively, click  ( <code>Shift+Enter</code> ) and select the desired file in the Select Path dialog.</li></ul>
Web Path	<p>In this text box, specify the URL address that corresponds to the server root. The server side of <a href="#">deployment mappings</a> will be specified relative to this URL.</p>

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	<p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

Name	<p>In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.</p>
Defaults	<p>This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.</p>
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	<p>Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.</p>

#### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application</li></ul>
---	---	--

or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	Alt+Delete	Click this icon to remove the selected task from the list.
	Enter	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	Alt+Up	Click this icon to move the selected task one line up in the list.
	Alt+Down	Click this icon to move the selected task one line down in the list.
Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

In this dialog box, create configurations for running and debugging of **Node.js** applications locally. "Locally" in the current context means that IntelliJ IDEA itself starts the **Node.js** runtime environment installed on your computer, whereupon initiates a running or debugging session.

On this page:

- [Getting access to the Run/Debug Configuration: Node.js dialog](#)
- [Configuration tab](#)
- [Browser / Live Edit tab](#)
- [V8 Profiling tab](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Node.js dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager \(npm\)](#).

## Configuration tab

**Tip** IntelliJ IDEA copies `package.json` to the `/tmp/project_modules` folder in the image, runs `npm install`, and then copies the modules to the project folder in the container. Consequently, changing `package.json` in the project results in re-building the image.

### ItemDescription

**Node Interpreter** In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in [Configuring Node.js Interpreters](#).

If you have [appointed one of the installations as default](#), the field displays the path to its executable file.

**Node Parameters** In this text box, type the Node.js-specific command line options to be passed to the NodeJS executable file. The most common options are:

`--require coffee-script/register` Specify this parameter to have CoffeeScript files compiled into JavaScript on the fly during run. This mode requires that the `register.js` file, which is a part of the `coffee-script` package, should be located inside the project. Therefore you need to install the `coffee-script` package on the [Node.js](#) page locally, as described in [NPM](#).

`--inspect` Specify this parameter when you are using Node.js v7 for [Chrome Debugging Protocol](#) support. Otherwise, by default the debug process will use [V8 Debugging Protocol](#).

For a full list, see [Node.js command line options](#).

**Working Directory** In this field, specify the [working directory](#) of the application. All references in the starting Node.js application file, for example, `imports`, will be resolved relative to this folder, unless such references use full paths. By default, the field shows the `project root folder`. To change this predefined setting, choose the desired folder from the drop-down list, or type the path manually, or click the Browse button  and select the location in the dialog box, that opens.

**JavaScript File** In this field, specify the full path to the file to start running or debugging the application from. If you are going to debug CoffeeScript, specify the path to the generated JavaScript file with source maps. The file can be generated externally or through compilation using file watchers. For more details, see [Compiling CoffeeScript to JavaScript](#).

**Application Parameters** In this text box, type the Node.js-specific arguments to be passed to the application start file through the `process.argv` array.

**Environment Variables** In this field, specify the [environment variables](#) for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:

- To define a new variable, click the Add toolbar button  and specify the variable name and value.
- To discard a variable definition, select it in the list and click the Delete toolbar button .
- Click OK, when ready

The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:

- `NODE_PATH` : A `:`-separated list of directories prefixed to the module search path.
- `NODE_MODULE_CONTEXTS` : Set to 1 to load modules in their own global contexts.
- `NODE_DISABLE_COLORS` : Set to 1 to disable colors in the REPL.

**Docker container settings** In this field, type the settings manually, or click  next to the field and specify the settings in the Edit Docker Container Settings dialog that opens, or select the Auto configure checkbox to have IntelliJ IDEA do it automatically. The field is available only when a remote Node.js interpreter running on a Docker container is chosen.

Auto configuration Select this checkbox to have IntelliJ IDEA configure the container settings. In the **Automatic configuration mode**:

- IntelliJ IDEA creates a new image and installs the `npm` modules in it.
- IntelliJ IDEA runs the container with the new image, binds your project folder to `/opt/project` folder in the container to ensure synchronization on update, and maps `/opt/project/node_modules` to the OS temporary directory.

Even with automatic configuration, you still need to bind the port on which your application is running with the port of the container. Those exposed ports are available on the Docker host's IP address (by default 192.168.99.100). Such binding is required when you debug the client side of a **Node.js Express** application. In this case, you need to open the browser from your computer and access the application at the container host through the port specified in the application.

1. Click  next to the Docker Container Settings field.
2. In the Edit Docker Container Settings dialog that opens, expand the Port bindings area.
3. Click  and in the Port bindings dialog that opens, map the ports as follows:
  - In the Container port text box, type the port specified in your application.
  - In the Host port text box, type the port through which you want to open the application in the browser from your computer.
  - In the Host IP text box, type the IP address of the Docker's host, the default IP is 192.168.99.100. The host is specified in the API URL field on the **Docker** page of the **Settings / Preferences Dialog**.
  - Click OK to return to the Edit Docker Container Settings dialog where the new port mapping is added to the list.
4. Click OK to return to the **Run/Debug Configuration: Node.js** dialog.

The field is available only when a remote Node.js interpreter running on a Docker container is chosen.

## Browser / Live Edit tab

In this tab, configure the behaviour of the browser and enable debugging the client-side code of the application. This functionality is provided through a **JavaScript Debug** run configuration, so technically, IntelliJ IDEA creates separate run configurations for the server-side and the client-side code, but you specify all your settings in one dedicated **Node.js** run configuration.

### ItemDescription

**Open browser** In the text box in this area, specify the URL address to open the application at. If you select the After Launch check box, the browser will open this page automatically after the application starts. Alternatively you can view the same result by opening the page with this URL address in the browser of your choice manually.

**After launch** Select this check box Choose the browser to use from the drop-down list next to the After launch checkbox.

- To use the system default browser, choose Default.
- To use a custom browser, choose it from the list. Note that **Live Edit** is fully supported only in Chrome.
- To configure browsers, click the Browse button  and adjust the settings in the Web Browsers dialog box that opens. For more information, see [Configuring Browsers](#).

with JavaScript debugger Select this check box to enable debugging the client-side code in the selected browser.

## V8 Profiling tab

### ItemDescription

**Record CPU profiling info** Select this checkbox to start logging the CPU profiling data when the application is launched. The controls in the area below become enabled. Specify the following:

- Log folder: in this field, specify the folder to store recorded logs in. Profiling data are stored in V8 log files `isolate-<session number>`.
- One log file for isolates:
- Tick package: in this field, specify the tick package to use. Choose the relevant package from the Tick package drop-down list or click the  button next to it and choose the package in the dialog box that opens.
- Gnuplot package: in this field, specify the location of the Gnuplot executable file to explore a timeline view that shows where V8 is spending time.

**Allow taking heap snapshots** Select this checkbox if you are going to run memory profiling. The controls in the area below become enabled. Specify the following:

- V8 profiler package: in this field, specify the **v8-profiler** package to use. Choose the relevant package from the v8-profiler package drop-down list or click the  button next to it and choose the package in the dialog box that opens.
- Communication port: in this field, specify the port through which IntelliJ IDEA communicates with the profiler, namely, sends a command to take a snapshot when you click the Take Heap Snapshot button  on the toolbar of the Run tool window.

## Toolbar

Before launch	<p>Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.</p>

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.
 

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.
 

See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.
 

This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.
 

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.
 

Specify the location of the Node.js interpreter, the parameters to pass

to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

File | Settings | Languages and Frameworks | Node.js and NPM for Windows and Linux

IntelliJ IDEA | Preferences | Languages and Frameworks | Node.js and NPM for macOS

The dialog box opens when you click the Browse button  next to the Node Interpreter drop-down list in the [Run/Debug Configuration: Node.js](#) dialog or on the [Node.js and NPM](#) page.

Use this dialog box to configure Node.js installations as local and remote interpreters.

The term **local Node.js interpreter** denotes a Node.js installation on your computer. The term **remote Node.js interpreter** denotes a Node.js installation on a remote host or in a virtual environment set up in a [Vagrant](#) instance. See [Configuring Node.js Interpreters](#) for details.

When the dialog box opens from the [Node.js and NPM](#) page, you can only configure local interpreters installed on your computer. When the dialog box is accessed from the [Run/Debug Configuration: Node.js](#) dialog, both local and remote interpreters can be configured.

#### ItemTooltipDescription

Node.js Interpreters		The list shows all the configured Node.js interpreters, both local and remote ones. For local interpreters, IntelliJ IDEA also shows the path to the Node.js executable file and to the associated <code>npm</code> executable file, see <a href="#">NPM</a> .
	Add	Click this button to add a new Node.js interpreter to the list. From the drop-down menu, choose All Local or Add Remote. Note that the Add Remote item is available only you opened the dialog box from the <a href="#">Run/Debug Configuration: Node.js</a> dialog. Depending on your choice, either select the relevant local Node.js installation or configure a remote interpreter in the <a href="#">Configure Node.js Remote Interpreter Dialog</a> that opens.
	Delete	Click this button to remove the selected interpreter from the list.
	Edit	Click this button to create a new interpreter with the settings copied from the selected one.
Node interpreter	This read-only field shows the path to the selected local interpreter.	
Npm package	In this field, specify the Node package manager (npm) associated with the selected interpreter. Choose the relevant npm from the drop-down list or click  next to it and in the dialog box that opens choose the location of the npm to use. Alternatively, you can specify the path to the <a href="#">Yarn package manager</a> if you want to use it instead of npm.  The field is available only if the selected interpreter is of the type local.	

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

The dialog box is available only when the **Node.js Remote Interpreter** plugin is enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

The dialog box opens when you click the Add toolbar button  in the **Node.js Interpreters Dialog** and choose Remote... from the drop-down menu. This menu item is available only when you open the **Node.js Interpreters Dialog** from the [Run/Debug Configuration: Node.js](#).

Use this dialog box to configure access to Node.js installations on remote hosts or in development environments set up in **Vagrant** instances.

#### ItemDescription

SSH Credentials	<p>Choose this option to configure access to a Node.js interpreter on a remote host through SSH credentials. In the fields of the dialog box, specify the following:</p> <ul style="list-style-type: none"><li>– Host: in this field, type the name of the host on which the interpreter is installed.</li><li>– Port: in this field, type the port which the SSH server on the remote host listens to. The default port number is 22.</li><li>– User name: in the field, type the user name under which you are registered on the SSH server.</li><li>– Auth type: from this drop-down list, choose the authentication method.<ul style="list-style-type: none"><li>– To access the host through a password, choose Password from the Auth type drop-down list, specify the password, and select the Save password checkbox to have IntelliJ IDEA remember it.</li><li>– To use <a href="#">SSH authentication</a> via a key pair, choose Key pair (OpenSSH or PuTTY). To apply this authentication method, you need to have your private key on the client machine and your public key on the remote server you connect to. IntelliJ IDEA supports private keys generated using the <a href="#">OpenSSH</a> utility. Specify the path to the file where your <b>private key</b> is stored and type the passphrase (if any) in the corresponding text boxes. To have IntelliJ IDEA remember the passphrase, select the Save passphrase checkbox.</li></ul></li><li>– If your SSH keys are managed by a credentials helper application (for example, <a href="#">Pageant</a> on Windows or <a href="#">ssh-agent</a> on Mac and Linux), choose Authentication agent (ssh-agent or Pageant).</li></ul> <p>To use an interpreter configuration, you need <b>path mappings</b> that set correspondence between the project folders, the folders on the server to copy project files to, and the URL addresses to access the copied data on the server. IntelliJ IDEA first attempts to retrieve path mappings itself by processing all the available application-level configurations. If IntelliJ IDEA finds the configurations with the same host as the one specified above, in the Host field, the mappings from these configurations are merged automatically. If no configurations with this host are found, IntelliJ IDEA displays an error message informing you that path mappings are not configured.</p> <p>To fix the problem, open the <a href="#">Deployment</a> page under the Build, Execution, Deployment node, select the server access configuration in question, switch to the Mappings tab, and map local folders to folders on the server as described in <a href="#">Creating a Remote Server Configuration</a>, section Mapping Local Folders to Folders on the Server and the URL Addresses to Access Them.</p>
Vagrant	<p>This option is available only when the <b>Vagrant</b> repository plugin is installed and enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the <b>JetBrains plugin repository</b> as described in <a href="#">Installing, Updating and Uninstalling Repository Plugins</a> and <a href="#">Enabling and Disabling Plugins</a>.</p> <p>Choose this option to configure access to a Node.js interpreter installed in a <b>Vagrant</b> instance using your <b>Vagrant</b> credentials. Technically, it is the folder where the <b>VagrantFile</b> configuration file for the desired environment is located. Based on this setting, IntelliJ IDEA detects the <b>Vagrant host</b> and shows it as a link in the Vagrant Host URL read-only field.</p> <p>To use an interpreter configuration, you need <b>path mappings</b> that set correspondence between the project folders, the folders on the server to copy project files to, and the URL addresses to access the copied data on the server. IntelliJ IDEA evaluates path mappings from the <b>VagrantFile</b> configuration file.</p>
Deployment Configuration	<p>This option is available only when the <b>Remote Hosts Access</b> plugin is enabled. The plugin is activated by default. If the plugin is disabled, enable it on the <a href="#">Plugins settings</a> page as described in <a href="#">Enabling and Disabling Plugins</a>.</p> <p>Choose this option to configure access to a Node.js interpreter on a remote host using a <b>server access configuration</b>. This option is available only if you have at least one <b>server access configuration</b> of the type SFTP, see <a href="#">Creating a Remote Server Configuration</a>.</p> <p>From the Deployment Configuration drop-down list, choose the <b>server access configuration</b> of the SFTP type according to which you want IntelliJ IDEA to connect to the target host. If the settings specified in the chosen configuration ensure successful connection, IntelliJ IDEA displays the URL address of the target host as a link in the Deployment Host URL field.</p> <p>To use an interpreter configuration, you need <b>path mappings</b> that set correspondence between the project folders, the folders on the server to copy project files to, and the URL addresses to access the copied data on the server. By default, IntelliJ IDEA retrieves path mappings from the chosen server access (deployment) configuration. If the configuration does not contain path mappings, IntelliJ IDEA displays the corresponding error message.</p> <p>To fix the problem, open the <a href="#">Deployment</a> page under the Build, Execution, Deployment node, select the relevant server access configuration, switch to the Mappings tab, and map the local folders to the folders on the server as described in <a href="#">Creating a Remote Server Configuration</a> section.</p>
Docker	<p>This option is available only when the <b>Node.js</b>, <b>Node.js Remote Interpreter</b>, and <b>Docker Integration</b> plugins are enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the <b>JetBrains plugin repository</b> as described in <a href="#">Installing, Updating and Uninstalling Repository Plugins</a> and <a href="#">Enabling and Disabling Plugins</a>. Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects. Choose this option to configure access to a Node.js interpreter running in a Docker container.</p> <p>In the Server field, specify the <b>Docker configuration</b> to use. see <a href="#">Docker</a>. Choose a configuration from the drop-</p>

1. In the Image name field, specify the base Docker image to use. Choose one of the previously downloaded or your custom images from the drop-down list or type the image name manually, for example, `node:argon` or `mhart/alpine-node`. When you later launch the run configuration, Docker will search for the specified image on your machine. If the search fails, the image will be downloaded from the image repository specified on the [Registry](#) page.
2. In the Image name field, specify the base Docker image to use. Choose one of the previously downloaded or your custom images from the drop-down list or type the image name manually, for example, `node:argon` or `mhart/alpine-node`. When you later launch the run configuration, Docker will search for the specified image on your machine. If the search fails, the image will be downloaded from the image repository specified on the [Registry](#) page.
3. The Node.js interpreter path field shows the location of the default Node.js interpreter from the specified image.
4. When you click OK, IntelliJ IDEA closes the [Configure Node.js Remote Interpreter Dialog](#) and brings you to the [Node.js Interpreters Dialog](#) where the new interpreter configuration is added to the list. Click OK to return to the run configuration.

---

**Node.js Interpreter Path**

In this field, specify the location of the **Node.js** executable file in accordance with the configuration of the selected remote development environment. By default IntelliJ IDEA suggests the `/usr/bin/node` folder for remote hosts and Vagrant instances and `node` for Docker containers. To specify a different folder, click the Browse button  and choose the relevant folder in the dialog box that opens. Note that the Node.js home directory must be open for edit. When you click OK, IntelliJ IDEA checks whether the Node.js executable is actually stored in the specified folder.

- If no Node.js executable is found, IntelliJ IDEA displays an error message asking you whether to continue searching or save the interpreter configuration anyway.
- If the Node.js executable is found, you return to the Node.js Interpreters where the installation folder and the detected version of the Node.js interpreter are displayed.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

In this dialog box, create configurations to run unit tests for **Node.js** applications.

On this page:

- [Getting access to the Run/Debug Configuration: NodeUnit dialog](#)
- [NodeUnit-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: NodeUnit dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager \(npm\)](#).
3. Install the **Nodeunit** testing framework in one of the following ways:
  - Download the framework at <https://github.com/caolan/nodeunit> and install it according to the official instructions.
  - Install the `nodeunit` package using the **Node Package Manager (NPM)** as described in [NPM](#).

## NodeUnit-specific configuration settings

### ItemDescription

Node Interpreter	In this field, specify the Node.js installation home. Type the path to the Node.js executable file manually, or click the Browse button  and select the location in the dialog box, that opens.
Working Directory	In this text box, specify the folder to find tests under. This can be the project root folder or the parent directory for the <code>test</code> folder. Type the path manually or click the Browse button  and select the location in the dialog box, that opens.
Environment Variables	<p>In this field, specify the <a href="#">environment variables</a> for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:</p> <ul style="list-style-type: none"><li>– To define a new variable, click the Add toolbar button  and specify the variable name and value.</li><li>– To discard a variable definition, select it in the list and click the Delete toolbar button .</li><li>– Click OK, when ready</li></ul> <p>The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:</p> <ul style="list-style-type: none"><li>– <code>NODE_PATH</code> : A  -separated list of directories prefixed to the module search path.</li><li>– <code>NODE_MODULE_CONTEXTS</code> : Set to 1 to load modules in their own global contexts.</li><li>– <code>NODE_DISABLE_COLORS</code> : Set to 1 to disable colors in the REPL.</li></ul>
Nodeunit Module	In this text box, specify the installation folder of the <b>Nodeunit</b> framework. Type the path manually or click the  button and choose the folder in the dialog box that opens.
Run	<p>From this drop-down list, choose the scope of tests to execute. The available options are:</p> <ul style="list-style-type: none"><li>– All JavaScript test files in the directory: choose this option to to have IntelliJ IDEA run all the test files in a folder. In the Directory text box below, specify the path to the test folder relative to the <a href="#">working directory</a>.</li><li>– JavaScript test file: choose this option to have a specific test executed. In the JavaScript test file text box, type the path to the file relative to the <a href="#">working directory</a>.</li></ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
		Edit defaults Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
		Move into new folder / Create new folder Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
		Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

In this dialog box, create configurations for running and debugging [JNode-webkit](#) applications.

On this page:

- [Node-Webkit-specific configuration settings](#)
- [Common options](#)

## Node-Webkit-specific configuration settings

### ItemDescription

**Node-webkit app** Specify the application to be launched. You can either select the entire directory that contains `package.json` file, or the same directory packed into an archive with the `.nw` extension.

Use the following buttons:

  Click this button to find the desired application in the file system.

 Click this button to add macros, specified in the [Path Variables](#) page of the IDE settings.

**Node-webkit arguments** Specify here the arguments to be passed to the application being launched.

Use the following button:

  Click this button to open the textual editor.

**Working directory** In this field, specify the working directory of the application.  
By default, the Working directory field shows the project root folder. To change this predefined setting, specify the path to the desired folder or choose a previously used folder from the list.

**Environment variables** In this field, specify the [environment variables](#) for the executable file, if applicable.

**Node-webkit interpreter** Specify executable for the Node-webkit.

Use the following buttons:

  Click this button to find the desired application in the file system.

 Click this button to add macros, specified in the [Path Variables](#) page of the IDE settings.

## Toolbar

### ItemShortcutDescription

  Click this button to add a new configuration to the list.

  Click this button to remove the selected configuration from the list.

  Click this button to create a copy of the selected configuration.

 **Edit defaults** Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

  Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

 **Move into new folder / Create new folder** Use this button to [create a new folder](#).  
If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

 **Sort configurations** Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members.  
If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

---

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

---

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

In the dialog that opens, select the goal to be run.<br/>For more information, see <a href="#">Maven</a>.</li><li>- Run Remote External tool : Add a remote SSH external tool. Refer to the section <a href="#">Remote SSH External Tools</a> for details.</li></ul> |

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that **code completion** is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Node.js Plugin is installed and enabled!

In this dialog box, create configurations for running [npm scripts](#) locally. "Locally" in the current context means that IntelliJ IDEA itself starts the **Node.js** runtime environment installed on your computer, whereupon initiates script execution.

On this page:

- [Getting access to the Run/Debug Configuration: NPM dialog](#)
- [Configuration tab](#)
  - [Toolbar](#)
  - [Common options](#)

## Getting access to the Run/Debug Configuration: NPM dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#).

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the run/debug configuration.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
package.json	In this field, specify the <code>package.json</code> file to run the scripts from. Choose the file from the drop-down list which shows all the <code>package.json</code> files detected in the current project or click  and choose the required <code>package.json</code> in the dialog box that opens.
Command	From this drop-down list, choose the <b>npm CLI command</b> to execute, by default <code>run-script</code> is selected. Learn more at <a href="#">npm documentation</a> , under the section CLI Commands.
Scripts	From this drop-down list, choose the script to which the chosen command will be applied. The list contains all the scripts defined within the <code>scripts</code> property in the <code>Package.json</code> file.
Arguments	In this field, specify the command line arguments to execute a script with. Learn more at <a href="#">Arguments</a> .
Node Interpreter	In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a> .  If you have <a href="#">appointed one of the installations as default</a> , the field displays the path to its executable file.
Node Options	In this text box, type the Node.js-specific command line options to be passed to the Node.js executable file. The acceptable options are:  <code>--require coffee-script/register</code> Specify this parameter to have CoffeeScript files compiled into JavaScript on the fly during run. This mode requires that the <code>register.js</code> file, which is a part of the <code>coffee-script</code> package, should be located inside the project. Therefore you need to install the <code>coffee-script</code> package on the <a href="#">Node.js</a> page locally, as described in <a href="#">NPM</a> .  <code>--inspect</code> Specify this parameter when you are using Node.js v7 for <a href="#">Chrome Debugging Protocol</a> support. Otherwise, by default the debug process will use <a href="#">V8 Debugging Protocol</a> .
Environment Variables	In this field, specify the <a href="#">environment variables</a> for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens: <ul style="list-style-type: none"><li>– To define a new variable, click the Add toolbar button  and specify the variable name and value.</li><li>– To discard a variable definition, select it in the list and click the Delete toolbar button .</li><li>– Click OK, when ready</li></ul> The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are: <ul style="list-style-type: none"><li>– <code>NODE_PATH</code> : A  -separated list of directories prefixed to the module search path.</li><li>– <code>NODE_MODULE_CONTEXTS</code> : Set to 1 to load modules in their own global contexts.</li><li>– <code>NODE_DISABLE_COLORS</code> : Set to 1 to disable colors in the REPL.</li></ul>

## Toolbar

### ItemShortcutDescription

-   Click this button to add a new configuration to the list.

		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools and External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the</li> </ul>
---	---	--

arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration**.

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.

Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

OpenShift Deployment [run/debug configurations](#) let you deploy your code and application artifacts to [OpenShift](#) . They also let you debug your applications.

For OpenShift Deployment run/debug configurations to be available, the OpenShift integration [plugin](#) must be enabled.

- [Main settings](#)

- [Toolbar](#)

## Main settings

### ItemDescription

Name	The name of the run configuration.
Share	<p>Select this checkbox to share the run configuration through version control.</p> <p>If the checkbox is not selected, the run configuration settings are stored in <code>.idea/workspace.xml</code> or the <code>.iws</code> file.</p> <p>If the checkbox is selected, the settings are stored in a separate <code>.xml</code> file in <code>.idea/runConfigurations</code> or in the <code>.ipr</code> file.</p> <p>See <a href="#">Configuring projects</a> .</p>
Single instance only	If you select this checkbox, only one instance of the run configuration will run at a time.
Server	<p>Select the cloud access configuration to be used.</p> <p>To create a new configuration, or to edit an existing one, click  ( <code>Shift+Enter</code> ). For more information, see <a href="#">OpenShift</a> .</p>
Deployment	To deploy your source code, select the corresponding <a href="#">module</a> . To deploy an <a href="#">application artifact</a> , select the artifact. Only archive artifact formats can be used (e.g. WAR, EAR).
Use custom application name	By default, your application will have about the same name as the module or the artifact. To specify a different name, select the checkbox and specify the name in the field. (The application name defines its URL.)
Debug Port	The port to be used for debugging. This may be any unused port on your computer.

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		<p>Click this icon to add a task to the list. Select the task to be added, for example:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li> <li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li> <li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> </ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page	<input type="checkbox"/>	Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window	<input type="checkbox"/>	If this checkbox is selected, the <a href="#">Debug tool window</a> opens when you start the run/debug configuration in the debug mode. Otherwise, the tool window isn't shown. However, when the configuration is running in the debug mode, you can open the Debug tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders.</p> <p>To create a folder, select the configurations to be grouped and click . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a>.</p>

Use this dialog box to set up options for running and debugging applications that use [OSGi Bundles](#) .

The dialog box consists of the following tabs:

- [Framework & Bundles](#)
- [Parameters](#)
- [Additional Framework Properties](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Framework & Bundles Tab

In this tab, select a framework that you need, compose a list of bundles to be installed, specify whether each bundle should be started upon installation, and define the order in which you want the bundles to be started.

### ItemDescription

OSGi Framework	From a drop-down list choose your framework.
Framework Start Level	Use this field to define a state of the execution in which a framework exists. You can modify the start level of the framework. This start level is used for managing the order of OSGi bundles' execution. If the bundle has a start level greater than the one for the framework, then it will be executed first.
Default Start Level	This field shows the default start level of bundles. In this case, the bundles are added after the framework's execution has started. You can modify the default start level for bundles.
Bundles Name	This read-only field shows the names of the OSGi bundles to be installed.
Start Level	In this text box, specify the default start level for newly installed bundles and thus determine the start order of bundles. The default value is 1.  <b>Note</b> An OSGi system has a current level (called the active start level). If a bundle has a start level higher than the active start level it will not start when the OSGi system starts. The bundle will start as soon as the active start level reaches or exceeds the start level of the bundle. Accordingly, if the active start level becomes below the level of a bundle, the bundle will be shutdown.
Start After Install	Select this checkbox to have the selected bundle after installation.
Add	Click this button to open the Select Bundles dialog box, which displays all the currently available bundles. If the list is large, start typing the bundle name Search field - the contents of the list change as you type and show only the matching entries.
Remove	Click this button to delete the selected bundle from the list.

## Parameters Tab

In these tab, customize the framework run or debug procedure by specifying additional parameters.

### ItemDescription

VM Options	In this text box, specify the string to be passed to the Virtual Machine for launching the bundles. If the string is too long and does not fit in the text box, click  and type the desired string in the VM Options dialog. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li></ul> <b>Note</b> The <code>-classpath</code> option specified in this field overrides the classpath of the module.
Program Parameters	In this text box, type a list of arguments to be passed to the program in the format you would use in the command line. If the string is too long and does not fit in the text box, click the  button and type the desired arguments in the Program Parameters dialog box. Use the same rules as for specifying the <a href="#">VM options</a> .
JRE	By default, the project JDK is used to run the bundles. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
Runtime Directory	Use this area to specify the runtime path of the framework.  You can select from the following options: <ul style="list-style-type: none"><li>- Recreate each time - select this option if you want to have all previous information deleted from the directory before the execution of the framework.</li><li>- Use this directory - use this field to specify the directory that the framework will use each time it executes. The execution time is faster. However, the directory might contain the unnecessary information such as artifacts from previous runs.</li></ul> Type the path to the desired folder manually or click the Browse button  and choose the folder in the <a href="#">dialog that opens</a> .
Include All Bundles in	Select this checkbox to have all the selected bundles included in the classpath.

## Additional Framework Properties

### ItemDescription

Debug Mode	Select this checkbox to enable debugging.
System Packages	In this text box, specify the system packages to be exposed inside the OSGi framework. Type the names of the packages using commas as separators. Wildcards are welcome.
Boot Delegation	In this text box, specify <code>java</code> packages for which the framework must delegate class loading to the boot class path. Type the names of the packages using commas as separators. Wildcards are welcome.
Start OSGi Console	Select this checkbox to run a prompt for the specified framework. For example, for the Equinox framework it is <code>osgi&gt;</code> .
Run	Use this area to indicate what target you need to run.  You can select from the following options: <ul style="list-style-type: none"> <li>– Just the bundles - select this option if you need to run just the bundles.</li> <li>– Product - select this option if you need to run the product.</li> <li>– Application - select this option if you need to run the application.</li> </ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this checkbox to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This checkbox is not available when editing the run/debug configuration defaults.
Single instance only	If this checkbox is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this checkbox is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

Alt+Up

Click this icon to move the selected task one line up in the list.

Alt+Down

Click this icon to move the selected task one line down in the list.

---

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to create configurations for running and debugging applications developed through integration with the help of [PhoneGap](#) , [Apache Cordova](#) , and [Ionic](#) frameworks and intended for running on various mobile platforms, including [Android](#) .

On this page:

- [Getting access to the Run/Debug Configuration: PhoneGap/Cordova dialog](#)
- [PhoneGap/Cordova/Ionic-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: PhoneGap/Cordova dialog

Make sure the **PhoneGap/Cordova** plugin is enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

## PhoneGap/Cordova/Ionic-specific configuration settings

### ItemDescription

---

PhoneGap/Cordova Executable Path In this field, specify the location of the executable file `phonegap.cmd` , `cordova.cmd` , or `ionic.cmd` (see [Installing PhoneGap/Cordova/Ionic](#) ).

---

PhoneGap/Cordova Working Directory In this field, specify the folder under which the **PhoneGap/Cordova/Ionic** application files to run are stored.

---

Command From this drop-down list, choose the command to run. The contents of the drop-down list, depend on the actually used framework, namely, on the executable file specified in the PhoneGap/Cordova Executable Path field. The available options are:

– For PhoneGap :

- emulate
- run
- prepare
- serve
- remote build
- remote run

See <https://www.npmjs.org/package/phonegap> for a list of **PhoneGap** -specific commands with descriptions.

– For Cordova :

- emulate
- run
- prepare
- serve

See <https://www.npmjs.org/package/cordova> for a list of **Cordova** -specific commands with descriptions.

– For Ionic :

- emulate
- run
- prepare
- serve

See <https://www.npmjs.org/package/ionic> for a list of **Ionic** -specific commands with descriptions.

---

Platform From this drop-down list, choose the platform for running on which the application is intended. The available options are:

- Android
- ios To emulate this platform, you need to install the [ios-sim command line tool](#) globally. You can do it through the Node Package Manager (npm) , see [NPM](#) or by running the `sudo npm install ios-sim -g` command, depending on your operating system.
- amazon-fireos
- firefoxos
- blackberry10
- ubuntu
- wp8
- windows8
- browser

Learn more about targeted platforms at

[http://docs.phonegap.com/en/edge/guide\\_platforms\\_index.md.html#Platform%20Guides](http://docs.phonegap.com/en/edge/guide_platforms_index.md.html#Platform%20Guides) and [http://cordova.apache.org/docs/en/4.0.0/guide\\_cli\\_index.md.html#The%20Command-Line%20Interface](http://cordova.apache.org/docs/en/4.0.0/guide_cli_index.md.html#The%20Command-Line%20Interface) .

---

Specify Target Select this checkbox to appoint an **Android** physical or virtual device to run the application on and select the required device from the drop-down list. The list shows all the virtual and physical devices that are currently configured on our machine. See [http://docs.phonegap.com/en/edge/guide\\_platforms\\_android\\_index.md.html#Android%20Platform%20Guide](http://docs.phonegap.com/en/edge/guide_platforms_android_index.md.html#Android%20Platform%20Guide) for details.  
If IntelliJ IDEA displays the following error message: **Cannot detect ios-sim in path** , make sure you have installed the `ios-sim` , see [Before you start](#) .

## Toolbar

## ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information,</li></ul>
---	---	--

see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure [running PHP applications on a local PHP built-in web server](#) . Note that this configuration is not intended for starting a debugging session. To debug an application running on the built-in server, start the application through this configuration and then connect to the running application as described in [Zero-Configuration Debugging](#) .

Click [here](#) for the description of the options that are common for all run/debug configurations.

The dialog box consists of the following areas:

**Note** [PHP built-in web server](#) is supplied with PHP 5.4 (and later) and is not built into IntelliJ IDEA. It is not suitable for production environments; you should use it only for development and testing purposes.

- [Server Configuration area](#)
- [Command Line area](#)
- [Toolbar](#)

## Server Configuration area

In this area, configure the access to the built-in Web server.

### ItemDescription

Host	In this text box, type the name of the host the PHP built-in web server runs on. By default, host is set to <code>localhost</code> , because the built-in server is located on your machine.
Port	Use this spin box to specify the port on which the PHP built-in web server runs. By default this port is set to port <code>80</code> . You can set the port number to any other value starting with 1024 and higher.
Document root	In this text box, type the full path to the folder that will be considered <a href="#">server document root</a> . This can be either the project root or any other folder under it. All the folders under the document root will be recursively submitted to the PHP interpreter. The server document root folder will be accessed through HTTP at the above specified <code>host:port</code> . URL addresses for other pages of your applications will be composed based on this mapping.  Type the path manually or click the Browse button  and choose the relevant folder in the dialog box that opens.
Use router script	Select this checkbox to have a <a href="#">PHP router script</a> executed at every HTTP request start-up. The script is run for each HTTP request. If this script returns <code>FALSE</code> , the requested resource is returned as-is. Otherwise the script output is returned to the browser. In the text box, specify the location of the script to run. Type the path manually or click the Browse button  and choose the file in the dialog box that opens.

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

Interpreter options	In this text box, specify the <a href="#">options</a> to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed. If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.
Custom working directory	In this text box, specify the location of the files that are outside the folder with your sources and are referenced through relative paths. Type the path manually or click the Browse button  and select the desired folder in the <a href="#">dialog that opens</a> .
Environment variables	In this field, specify the <a href="#">environment variables</a> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a> for details.

## Toolbar

### ItemShortcutDescription

	 <code>Alt+Insert</code>	Click this button to add a new configuration to the list.
	 <code>Alt+Delete</code>	Click this button to remove the selected configuration from the list.
	 <code>Ctrl+D</code>	Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 <code>Alt+Up</code> or <code>Alt+Down</code>	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug

new folder configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure running and debugging of separate [HTTP Requests](#) . This is helpful when you are actually interested in a specific page that is accessed in a number of steps, but for this or that reason you cannot specify this page as the start page for debugging, for example, because you need to "come" to this page with certain data. For details, see [Debugging a PHP HTTP Request](#) .

The dialog box consists of the following areas:

- [Configuration](#)
- [Toolbar](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration

### ItemDescription

Server	From this drop-down list, select the <a href="#">server access configuration</a> to interact with the Web server where the application is executed.
URL	In this text box, specify the <code>host</code> element of the request in question. Type the element relative to the host specified in the debug server configuration, see <a href="#">Creating a PHP Debug Server Configuration</a> . As you type, IntelliJ IDEA composes the URL address on-the-fly and displays it below the text box.
Request method	From this drop-down list, choose the relevant request type. The available options are: <ul style="list-style-type: none"><li>– POST</li><li>– GET</li></ul>
Query String	In this text box, type the query string of the request, this string will be appended to the request after the <code>?</code> symbol.
Request Body	In this text box, type the data to be sent to the server through the <b>POST</b> request. The text box is available only for request methods of the type <b>POST</b> . By default, the <b>Project Encoding</b> is used in requests encoding if it is not specified explicitly, for example:

```
header('Content-type: text/html;charset=utf-8');
```

The **Project Encoding** is specified on the [File Encodings](#) page, under the **Editor** node of the [Settings / Preferences Dialog](#) .

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	<b>Edit defaults</b>	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	<b>Move into new folder / Create new folder</b>	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	<b>Sort configurations</b>	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**Item** **Keyboard shortcut**

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and

command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure debugging of PHP applications on a remote server.

The dialog box consists of the following areas:

- [Configuration](#)
- [Toolbar](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration

### ItemDescription

Server	Use this drop-down list to specify the Web server configuration to use. The list shows all the configurations that are currently available in IntelliJ IDEA.
	Click this button to open the <a href="#">Deployment</a> page and view the details of the selected configuration there.
Ide key (session id)	In this text box, specify the key to identify the debugging session.
Debug	Use the controls in this area to configure behaviour of the debugging tool. <ul style="list-style-type: none"><li>- Break at the first line - select this checkbox to have the debugging tool stop at the first line of the source code.</li></ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

## ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

---

		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<hr/>		
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<hr/>		
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure running and debugging of single PHP files locally using a PHP console.

Click [here](#) for the description of the options that are common for all run/debug configurations.

The dialog box consists of the following areas:

- [Configuration area](#)
- [Command Line area](#)
- [Debug area](#)
- [Common options](#)

## Configuration area

In this area, specify the script to run or debug and the parameters to process it with, if applicable.

### ItemDescription

File	In this text box, specify the location of the file to run or debug. Type the path to the file manually or click the Browse button  and select the desired location in the Choose PHP File dialog box that opens.
Arguments	In this text box, type the list of arguments to be passed to the PHP script, same way as if you were entering these parameters in the command line. If necessary, click  and type the desired switches in the Arguments dialog box. Type each argument on a new line. As you type, they appear in the Arguments text box with spaces as separators.

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

Interpreter options	In this text box, specify the <a href="#">options</a> to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed. If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.
Custom working directory	In this text box, specify the location of the files that are outside the folder with the script and are referenced in your script through relative paths. Type the path manually or click the Browse button  and select the desired folder in the <a href="#">dialog that opens</a> . This setting does not block the script execution because the script location is always specified through a full path.
Environment variables	In this field, specify the <a href="#">environment variables</a> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a> for details.

## Debug area

Use the controls in this area to configure behaviour of the debugging tool.

### ItemDescription

Break at the first line	Select this checkbox to have the debugging tool stop at the first line of the source code.
-------------------------	--

## Toolbar

### ItemShortcutDescription

	 Alt+Insert	Click this button to add a new configuration to the list.
	 Alt+Delete	Click this button to remove the selected configuration from the list.
	 Ctrl+D	Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 Alt+Up or  Alt+Down	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure running and debugging of PHP applications on a remote server. According to the settings of this configuration, IntelliJ IDEA fully controls the debugging process: it launches the application, opens the browser, and activates the debugging engine. A PHP Web Application debug configuration tells IntelliJ IDEA the URL address to access the starting page of the application, the browser to open the starting page in, and the [debug server configuration](#) to use. For details, see [Debugging with a PHP Web Application Debug Configuration](#).

Click [here](#) for the description of the options that are common for all run/debug configurations.

The dialog box consists of the following areas:

- [Configuration area](#)
- [Toolbar](#)

## Configuration area

### ItemDescription

Server	Use this drop-down list to specify the Web server configuration to use. The list shows all the configurations that are currently available in IntelliJ IDEA.
	Click this button to open the <a href="#">Servers</a> page and view the details of the selected configuration there.
Start URL	In this area, compose the URL address to access the application through. In the Start URL text box, specify the local file that implements the starting page of the application. Type the path to the desired file relative to the folder that is mapped to the root folder of the target host. IntelliJ IDEA concatenates the host root URL with the specified relative path and shows the URL address of the application starting page in the read-only field below.
Browser	From this drop-down list, select the Web browser to open the application in.
Debug	Use the controls in this area to configure behaviour of the debugging tool. <ul style="list-style-type: none"><li>- Break at the first line - select this checkbox to have the debugging tool stop at the first line of the source code.</li></ul>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

Item	Keyboard shortcut	Description
------	-------------------	-------------

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

---

This feature is only supported in the Ultimate edition.

This dialog box is available only when the PHP and PHPSpec plugins are installed and enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#). Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

Use this dialog box to create a configuration to be used for running and debugging unit tests on PHP applications using the PHPSpec toolset.

On this page:

- [Before you start](#)
- [Test Runner area](#)
- [Command Line area](#)
- [Toolbar](#)
- [Common options](#)

## Before you start

To run PHPSpec tests:

1. Install and configure the [PHPSpec](#) toolset on your computer as described in [Testing with PHPSpec](#).
2. Make sure the PHP and PHPSpec plugins are installed and enabled. The plugins are not bundled with IntelliJ IDEA, but they can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#). Once enabled, the plugins are available at the IDE level, that is, you can use them in all your IntelliJ IDEA projects.

## Test Runner area

In this area, appoint the specifications to launch and the command line switches to be passed to PHPSpec.

### ItemDescription

Test scope	<p>In this area, specify the location of specifications or the configuration file where they are listed.</p> <ul style="list-style-type: none"><li>– Directory: select this option to have all the specifications in a directory launched. In the Directory text box, appoint the directory to search for <code>*Spec.php</code> files with specifications in. Type the path to the directory manually or click the Browse button  and select the desired directory in the Choose Test Directory dialog box, that opens.</li><li>– File: select this option to have all the specifications in a particular <code>*Spec.php</code> file launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the <code>*Spec.php</code> file to search the specifications in. Type the path to the file manually or click the Browse button  and select the desired directory in the dialog box, that opens.</li><li>2. In the Class text box, specify the desired class. Type the class name manually or click the Browse button  and select the desired class in the tree view, that opens.</li></ol></li><li>– Specification: select this option to have a particular specification launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the <code>*Spec.php</code> file to search for the specification in. Type the file name manually or click the Browse button  and select the desired file in the tree view, that opens.</li><li>2. In the specification text box, type the desired specification.</li></ol></li><li>– Defined in the configuration file: select this option to have PHPSpec execute the tests from a dedicated <code>.yaml</code> configuration file. By default, PHPSpec uses the configuration file appointed in the Test Runner area of the <a href="#">Test Frameworks</a> page. In its turn, this can be either the native configuration file (<code>phpspec.yaml</code> or <code>phpspec.yaml.dist</code>) or any other <code>.yaml</code> configuration file which you specified as Default during the initial configuration of PHPSpec in IntelliJ IDEA.<ul style="list-style-type: none"><li>– To have the default for all PHPSpec run configurations file used, clear the Use alternative configuration file checkbox.</li><li>– To launch specifications from a custom configuration file, select the Use alternative configuration file checkbox and specify the location of the desired <code>.yaml</code> file in the text box next to it.</li><li>– To open the PHPSpec page and specify another default configuration file to use, click the  button.</li></ul></li></ul>
------------	---

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

Interpreter options	<p>In this text box, specify the <a href="#">options</a> to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed.</p> <p>If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.</p>
Custom working directory	<p>In this text box, specify the location of the files that are outside the folder with tests and are referenced in your tests through relative paths.</p> <p>This setting does not block the test execution because the location of tests is always specified through a full path to the corresponding files and/or directories.</p> <p>By default, the field is empty and the working directory is the root of the project.</p>
Environment	<p>In this field, specify the <a href="#">environment variables</a> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a></p>

variables for details.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.</li></ul>
---	---	--

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to create a configuration to be used for running and debugging unit tests on PHP applications in the console using the **PHPUnit** framework. Click [here](#) for the description of the options that are common for all run/debug configurations.

On this page:

- [Before you start](#)
- [Test Runner area](#)
- [Command Line area](#)
- [Toolbar](#)
- [Common options](#)

## Before you start

To run **PHPUnit** tests:

1. Install and configure the [PHPUnit](http://www.phpunit.de/manual/current/en/installation.html) tool on your computer, see <http://www.phpunit.de/manual/current/en/installation.html> .
2. Make sure the **PHP** plugin is installed and enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

## Test Runner area

In this area, specify the unit tests to launch and the command line switches to be passed to the test runner.

### ItemDescription

Test scope	<p>In this area, specify the location of tests or the configuration file where they are listed.</p> <ul style="list-style-type: none"><li>– Directory: select this option to have all the unit tests in a directory launched. In the Directory text box, specify the directory to search the unit test in. Type the path to the directory manually or click the Browse button  and select the desired directory in the Choose Test Directory dialog box, that opens.</li><li>– Class: select this option to have all the unit tests in a test class launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the file to search the class in. Type the path to the file manually or click the Browse button  and select the desired directory in the Choose Test File dialog box, that opens.</li><li>2. In the Class text box, specify the desired class. Type the class name manually or click the Browse button  and select the desired class in the tree view, that opens.</li></ol></li><li>– Method: select this option to have a specific test method launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the file to search for the test method in. Type the file name manually or click the Browse button  and select the desired file in the tree view, that opens.</li><li>2. In the Method text box, specify the desired method.</li></ol></li><li>– Defined in the configuration file: select this option to have test runner execute the tests from a dedicated XML file.<ul style="list-style-type: none"><li>– To use the default configuration file specified on the <a href="#">Test Frameworks</a> page of the Settings dialog box, clear the Use alternative configuration file checkbox. If no default configuration file is appointed on the PHPUnit page, the run/debug configuration is invalid.</li><li>– To run the tests from a custom configuration file, select the Use alternative configuration file checkbox and specify the location of the file to use in the text box.</li></ul></li></ul>
------------	--

Test runner options	<p>In this text box, specify the <a href="#">test runner switches</a> .</p> <p>If necessary, click  and type the desired switches in the Command Line Options dialog box. Type each switch on a new line. When you close the dialog box, the specified switches are displayed in the Test runner options text box with spaces as separators.</p>
---------------------	---

## Command Line area

In this area, customize the behavior of the current PHP interpreter by specifying the options and arguments to be passed to the PHP executable file.

### ItemDescription

Interpreter options	<p>In this text box, specify the <a href="#">options</a> to be passed to the PHP executable file. They override the default behavior of the PHP interpreter and/or ensure that additional activities are performed.</p> <p>If necessary, click  and type the desired options in the Command Line Options dialog box. Type each option on a new line. When you close the dialog box, they are all displayed in the Command line options text box with spaces as separators.</p>
Custom working directory	<p>In this text box, specify the location of the files that are outside the folder with tests and are referenced in your tests through relative paths.</p> <p>This setting does not block the test execution because the location of tests is always specified through a full path to the corresponding files and/or directories.</p> <p>By default, the field is empty and the working directory is the root of the project.</p>
Environment variables	<p>In this field, specify the <a href="#">environment variables</a> be passed to the built-in server. See <a href="#">Environment Variables in Apache</a> for details.</p>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"> <li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>– Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>grunt-cli</code> package.</li> <li>– Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the <code>Gulpfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.</li> </ul>
---	---	---

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to configure running unit tests of PHP applications on a remote server.> Click [here](#) for the description of the options that are common for all run/debug configurations.

On this page:

- [Before you start](#)
- [Configuration tab](#)
- [Test Groups tab](#)
- [Remote tab](#)
- [Toolbar](#)
- [Common options](#)

## Before you start

To run PHPUnit tests:

1. Install and configure the [PHPUnit](http://www.phpunit.de/manual/current/en/installation.html) tool on your computer, see <http://www.phpunit.de/manual/current/en/installation.html> .
2. Make sure the [PHP](#) plugin is installed and enabled. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

## Configuration tab

In this tab, specify the unit tests to launch and the command line switches to be passed to the test runner.

### ItemDescription

Test	<p>In this area, specify the location of tests or the configuration file where they are listed.</p> <ul style="list-style-type: none"><li>– All in Directory: select this option to have all the unit tests in a directory launched. In the Directory text box, specify the directory to search the unit test in. Type the path to the directory manually or click the Browse button  and select the desired directory in the Choose Test Directory dialog box, that opens.</li><li>– All in File: select this option to have all the unit tests in a test class or a file launched. In the File text box, specify the file to search the class or suite in. Type the path to the file manually or click the Browse button  and select the desired directory in the Choose Test File dialog box, that opens.</li><li>– Class or Suite: select this option to have all the unit tests in a test class or a test suite launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the file to search the class or suite in. Type the path to the file manually or click the Browse button  and select the desired directory in the Choose Test File dialog box, that opens.</li><li>2. In the Class text box, specify the desired class. Type the class name manually or click the Browse button  and select the desired class in the tree view, that opens.</li></ol></li><li>– Method: select this option to have a specific test method launched.<ol style="list-style-type: none"><li>1. In the File text box, specify the file to search for the test method in. Type the file name manually or click the Browse button  and select the desired file in the tree view, that opens.</li><li>2. In the Method text box, specify the desired method.</li></ol></li><li>– XML file: select this option to have the test runner execute the tests from an XML configuration file.<ul style="list-style-type: none"><li>– To use the default configuration file specified on the <a href="#">Test Frameworks</a> page of the Settings dialog box, clear the Use alternative configuration file checkbox. If no default configuration file is appointed on the PHPUnit page, the run/debug configuration is invalid.</li><li>– To run the tests from a custom configuration file, select the Use alternative configuration file checkbox and specify the location of the file to use in the text box.</li></ul></li></ul>
------	---

### Test Runner options

Custom working directory	<p>In this text box, specify the location of the files that are outside the folder with tests and are referenced in your tests through relative paths. Type the path manually or click the Browse button  and select the desired folder in the <a href="#">dialog that opens</a> .</p> <p>This setting does not block the test execution because the location of tests is always specified through a full path to the corresponding files and/or directories.</p>
--------------------------	--

## Test Groups tab

In this tab, appoint the groups of tests to execute when the tests are run according to the current run configuration.

[Grouping tests](#) is helpful, for example, to distinguish between tests to run in a production environment from those to run in your development environment. You just need to create two groups and then include or exclude them depending on the current environment.

To attach a test to a group, tag it with the [@group](#) annotation in the format:

```
/**
 * @group <group specification>
 */
```

To enable filtering tests based on their authors, tag the tests with the [@author](#) annotation.

## ItemDescription

Include/Exclude groups	Select this checkbox to enable <a href="#">configuring execution of test groups</a> .
Group Name	In this read-only list, select the test group to be involved or skipped in testing.
Include	Select this checkbox to have the tests from the selected test group executed.
Exclude	Select this checkbox to have the tests from the selected test group skipped.

## Remote tab

In this tab, configure deployment of tests to a remote server.

## ItemDescription

Debug server	In this field, specify the configuration through which the debugging engine will interact with the server through HTTP. Actually, a configuration consist of a URL address of the target environment, the debugger type, and possibly mappings between folders in your project and their correspondences on the server. Choose a configuration from the drop-down list or click the Browse button  and define a new configuration in the <a href="#">Servers</a> dialog box that opens.
Upload test directory before run	<ul style="list-style-type: none"><li>– When this checkbox is selected, IntelliJ IDEA automatically uploads tests to the default server according to the deployment options.</li><li>– When the checkbox is cleared, you have to upload tests manually, see <a href="#">Uploading and Downloading Files</a> .</li></ul> <p>The checkbox is by default selected.</p>
Remove test files after run	<ul style="list-style-type: none"><li>– When this checkbox is selected, IntelliJ IDEA automatically removes the executed tests from the server upon execution.</li><li>– When the checkbox is cleared, tests remain on the server after execution and you will have to download them manually, see <a href="#">Uploading and Downloading Files</a> .</li></ul>
Show transfer logs	Select this checkbox to have test deployment logged.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

Item	Keyboard shortcut	Description
------	-------------------	-------------

- |   |   |  |
|---|---|--|
|  |  | <p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that <a href="#">code completion</a> is available here.</li></ul> |
|---|---|--|

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

---

Use this dialog to create a run/debug configuration to be used for running and debugging the plugin projects.

This section provides descriptions of the [configuration-specific items](#), as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

VM options	Specify the string passed to the VM for launching the plugin. Usually this string contains the options such as <code>-mx</code> , <code>-verbose</code> , etc. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code>.</li></ul>
Program arguments	Type the list of arguments to be passed to the program, same way as if you were entering these parameters in the command line. Use the same rules as for specifying the <a href="#">VM options</a> .
Use classpath of module	Select the module whose classpath should be used to run the application.
Use alternative JRE	Select this checkbox to enable defining another JRE than the JRE used by the current project / module.
Show idea.log	If selected, makes IntelliJ IDEA show content of the <code>idea.log</code> file in the console while running the plugin.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription**  
**shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

Alt+Delete

Click this icon to remove the selected task from the list.

Enter

Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

---

Alt+Up

Click this icon to move the selected task one line up in the list.

---

Alt+Down

Click this icon to move the selected task one line down in the list.

---

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog to create or edit [run/debug configuration](#) for Play 2 framework.

This section provides descriptions of the [configuration-specific items](#), as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

#### ItemDescription

Open in browser	Use this area to specify the following browser options: <ul style="list-style-type: none"><li>– Open in browser after compilation - this checkbox lets you open your compilation results in a browser. By default, the checkbox is selected.</li><li>– Uri To Open - this field shows you the default url address.</li></ul>
JVM Options	Use this field to specify JVM options. By default, the JVM options are specified in this field.
Environment variables	Use this field to set the environment variables.
Use non-default Play 2 install dir	Select this checkbox to use non-default Play 2 installation directory.
Debug Port	Use this field to specify the debug port. Play 2 framework uses 9999 as a default debug port.
Enable auto-reload	Select this checkbox to specify the auto-reload. In this case Play 2 framework detects changes in source files and recompiles them.

## Toolbar

#### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for running and debugging **AngularJS unit tests** using the **Protractor test runner**.

On this page:

- [Getting access to the Run/Debug Configuration: Protractor dialog](#)
- [Protractor-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Protractor dialog

1. **Install** and **enable** the Node.js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).
2. Download and install the [Node.js](#) runtime environment that contains the [Node Package Manager\(npm\)](#).
3. Using the **Node Package Manager**, install the [Protractor test framework](#) as described in [AngularJS](#).
4. Make sure the **AngularJS** plugin is activated. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

## Protractor-specific configuration settings

### ItemDescription

Name	In this text box, specify the name of the run/debug configuration.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Configuration file	In this field, specify the location of the <b>Protractor configuration file</b> . Normally, the file has the extensions <code>protractor.conf.js</code> .
Node interpreter	<p>In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click <code>...</code> and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a>.</p> <p>If you have <a href="#">appointed one of the installations as default</a>, the field displays the path to its executable file.</p>
Protractor package	In this field, specify the Protractor installation home <code>/npm/node_modules/protractor</code> . If you installed <b>Protractor</b> regularly through the <b>Node Package Manager</b> , IntelliJ IDEA detects the Protractor installation home itself. Alternatively, type the path to executable file manually, or click the Browse button <code>...</code> and select the location in the dialog box, that opens.
Environment variables	<p>In this field, specify the <a href="#">environment variables</a> for the Node.js executable file, if applicable. Click the Browse button <code>...</code> to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:</p> <ul style="list-style-type: none"><li>– To define a new variable, click the Add toolbar button <code>+</code> and specify the variable name and value.</li><li>– To discard a variable definition, select it in the list and click the Delete toolbar button <code>-</code>.</li><li>– Click OK, when ready</li></ul> <p>The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:</p> <ul style="list-style-type: none"><li>– <code>NODE_PATH : A :</code> -separated list of directories prefixed to the module search path.</li><li>– <code>NODE_MODULE_CONTEXTS</code> : Set to 1 to load modules in their own global contexts.</li><li>– <code>NODE_DISABLE_COLORS</code> : Set to 1 to disable colors in the REPL.</li></ul>

## Toolbar

### ItemShortcutDescription

	<code>Alt+Insert</code>	Click this button to add a new configuration to the list.
	<code>Alt+Delete</code>	Click this button to remove the selected configuration from the list.
	<code>Ctrl+D</code>	Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	<code>Alt+Up</code> or <code>Alt+Down</code>	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug

new folder configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to

execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for launching a Pyramid server .

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Config file	In this field, specify the name of the configuration file <code>development.ini</code> .
Additional options	In this field, type the additional options to be passed to the server. These are the options that <code>pserve</code> accepts. Use <code>pserve --help</code> to learn more about the additional options.
Run browser	Select this check box, if you want your Pyramid application to open in the default browser. In the text field below, enter the IP address where your application will be opened.
Project	Click this drop-down list to select one of the projects, <a href="#">opened in the same IntelliJ IDEA window</a> , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.
Environment variable	This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.  To fill in the list, click the browse button, or press <code>Shift+Enter</code> and specify the desired set of environment variables in the Environment Variables dialog box.  To create a new variable, click <code>+</code> , and type the desired name and value.  By default, the variable <code>PYTHONUNBUFFERED</code> is set to 1.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>+</code> , and type the string in the editor.
Working directory	Specify a directory to be used by the running task. <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing <a href="#">Run</a> on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	This field appears, if a remote interpreter has been selected in the field Python interpreter .  Click the browse button <code>...</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.
Add content roots to PYTHONPATH	Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;
Add source roots to PYTHONPATH	Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li></ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .

Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"> <li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is</li> </ul>
---	---	--

specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.

Show this page  Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

On this page:

- [Prerequisites](#)
- [Configuration tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Python, make sure that Python plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Python SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Python](#)
- [Django](#)

Use this dialog box to create a run/debug configuration for Python scripts .

## Configuration tab

### ItemDescription

Script	In this text box, specify the name of the Python script to be executed.
Script parameters	<p>In this text box, specify parameters to be passed to the Python script.</p> <p>When specifying the script parameters, follow these rules:</p> <ul style="list-style-type: none"><li>- Use spaces to separate individual script parameters.</li><li>- Script parameters containing spaces should be delimited with double quotes, for example, <code>some "param" or "some param"</code> .</li><li>- If script parameter includes double quotes, escape the double quotes with backslashes, for example:</li></ul> <pre>-s"main.snap_source_dirs=[\"pcomponents/src/main/python\"]" -s"http.cc_port=8189" -s"backdoor.port=9189" -s"main.metadata={\"location\": \"B\", \"language\": \"python\", \"platform\": \"unix\"}"</pre>
Project	Click this drop-down list to select one of the projects, <a href="#">opened in the same IntelliJ IDEA window</a> , where this run/debug configuration should be used. If there is only one open project, this field is not displayed.
Environment variable	<p>This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.</p> <p>To fill in the list, click the browse button, or press <code>Shift+Enter</code> and specify the desired set of environment variables in the Environment Variables dialog box.</p> <p>To create a new variable, click <code>+</code> , and type the desired name and value.</p> <p>By default, the variable <code>PYTHONUNBUFFERED</code> is set to 1.</p>
Emulate terminal in output node	<p>On Linux and macOS systems, select this checkbox to emulate the terminal in the <a href="#">Run tool window</a> .</p> <p>On Windows system, this option is not visible!</p>
Show command line afterwards	Select this checkbox to leave the console opened after a project run or a debug session, saving its context.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>+</code> , and type the string in the editor.
Working directory	<p>Specify a directory to be used by the running task.</p> <ul style="list-style-type: none"><li>- When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>- When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	<p>This field appears, if a remote interpreter has been selected in the field Python interpreter .</p> <p>Click the browse button <code>...</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.</p>
Add content roots to	Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;

## PYTHONPATH

Add source roots to PYTHONPATH Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

## Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed though this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its `name` or `id`.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for

newly created configurations.

Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder

Use this button to [create a new folder](#) . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required

task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#).  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use these pages to create run/debug configurations for the supported inline documentation frameworks.

Click [+](#) to select the stub run/debug configuration of one of the following types:

- [Run/Debug Configuration: Sphinx Task](#)

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for a [DocUtils](#) task, which allows you to produce documentation in some reasonable format (for example, HTML), from a file in the [reStructuredText](#) format.

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Command	Select the command that will be used to convert the specified *.rst file. The selected command stipulates the output format of the documentation.
Input	Specify the fully qualified path to the source *.rst file. Type the path manually, or click the browse button, and choose the desired *.rst file from the file chooser dialog. Alternatively, you can press <code>Shift+Enter</code> to open the file chooser dialog.
Output	Specify the fully qualified path to the generated file. Type the path manually, or click the browse button, and choose the desired file from the file chooser dialog. Alternatively, you can press <code>Shift+Enter</code> to open the file chooser dialog.
Option	In this text field, type the keys the script will be launched with.
Open output file in browser	If this checkbox is selected, IntelliJ IDEA will automatically open the generated documentation in the <a href="#">default browser</a> . Note that the checkbox is disabled, when it is irrelevant to the command selected in the Command drop-down list.
Environment variable	Click the browse button, or press <code>Shift+Enter</code> to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click <code>+</code> , and type the desired name and value.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>+</code> , and type the string in the editor.
Working directory	Specify a directory to be used by the running task. <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code>, or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	This field appears, if a remote interpreter has been selected in the field Python interpreter.  Click the browse button <code>...</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.
Add content roots to PYTHONPATH	Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;
Add source roots to PYTHONPATH	Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;

Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click `...` to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed though this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its name or id.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

Single instance only If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or

debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<b>Show this page</b>		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<b>Active tool window</b>		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for a [Sphinx](#) task, which allows you to produce documentation in some reasonable format (for example, HTML), from a file in the [reStructuredText](#) format.

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Command	Select the command that will be used to convert the specified *.rst file. The selected command stipulates the output format of the documentation.
Input	Specify the fully qualified path to the source *.rst file. Type the path manually, or click the browse button, and choose the desired *.rst file from the file chooser dialog. Alternatively, you can press <code>Shift+Enter</code> to open the file chooser dialog.
Output	Specify the fully qualified path to the generated directory where the generated files will be placed. Type the path manually, or click the browse button, and choose the desired file from the file chooser dialog. Alternatively, you can press <code>Shift+Enter</code> to open the Select Path dialog.
Option	In this text field, type the keys the script will be launched with.
Environment variable	Click the browse button, or press <code>Shift+Enter</code> to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click <code>+</code> , and type the desired name and value.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>⌨</code> , and type the string in the editor.
Working directory	Specify a directory to be used by the running task. <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code>, or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	This field appears, if a remote interpreter has been selected in the field Python interpreter.  Click the browse button <code>⌨</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.
Add content roots to PYTHONPATH	Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;
Add source roots to PYTHONPATH	Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;

### Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click `⌨` to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its name or id.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click `▼` to expand the tables. Click `+`, `-` or `⌨` to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li></ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the

same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

---

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**ItemKeyboardDescription**  
**shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#).  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

---

	<input type="text" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="text" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="text" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="text" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use the remote debug configuration to launch the debug server. Refer to the [Remote Debugging](#) topic for additional information.

#### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Update your script	This section contains vital information required to prepare for remote debugging.  Add <code>pycharm-debug.egg</code> from the <code>debug-eggs</code> directory under IntelliJ IDEA installation to the Python path. See procedure description in <a href="#">Remote Debugging</a> .  Add the following import statement <pre>import pydevd</pre> Copy the import statement from this read-only field, and paste it in your local script:  Add the following command to connect to the debug server <pre>pydevd.settrace(&lt;host name&gt;, port=&lt;port number&gt;)</pre> When <code>&lt;host name&gt;</code> is taken from the Local host name field of this debug configuration. - <code>&lt;port number&gt;</code> is the number taken from the Port field of this debug configuration, or, if it has not been specified, some random number written to the console.  Note that the parameters of this command depend on the settings specified in this page. The command with the default settings is: <pre>nvdev.pydevd.settrace('localhost', port=\$SERVER_PORT, stdoutToServer=True, stderrToServer=True)</pre> which corresponds to the host name 'localhost', port number 0, selected checkboxes Redirect output to console and Suspend after connect .
Local host name	Specify the name of the local host, by which the IDE is accessible from the remote host. This host name will be automatically substituted to the command line. By default, <code>localhost</code> is used.
Port	Specify the port number, which will be automatically substituted to the command line. If the default port number (0) is used, then IntelliJ IDEA substitutes an arbitrary number to the command line at each launch of this debug configuration; if you specify any other value, it will be used permanently.
Path mappings	Use this field to create mappings between the local and remote paths. Clicking the browse button  results in opening Edit Path Mappings dialog box, where you can add new path mappings, and delete the selected ones.
Redirect output to console	If this checkbox is selected, the output and error streams will be redirected to the IntelliJ IDEA console, and the command line is complemented with the <code>stdoutToServer=True, stderrToServer=True</code>
Suspend after connect	If this checkbox is selected, the debugger will suspend immediately after connecting to the IDE, on the next line after the <code>settrace</code> call.  If this checkbox is not selected, the debugger will only suspend upon hitting a breakpoint, or clicking  , and the command line is complemented with <code>suspend=False</code>

## Toolbar

#### ItemShortcutDescription

	<code>Alt+Insert</code>	Click this button to add a new configuration to the list.
	<code>Alt+Delete</code>	Click this button to remove the selected configuration from the list.
	<code>Ctrl+D</code>	Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	<code>Alt+Up</code> or <code>Alt+Down</code>	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use these pages to create run/debug configurations for the supported testing frameworks.

Click  to select the stub run/debug configuration of one of the following types:

- [Run/Debug Configuration: Doctests](#)
- [Run/Debug Configuration: Python Unit Test](#)
- [Run/Debug Configuration: py.test](#)
- [Run/Debug Configuration: Nosetests](#)
- [Run/Debug Configuration: attests](#)

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for [Doctests](#) .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Tests	<p>Click one of the radio-buttons to define the testing scope (all tests in a folder, all tests in a script, a test class, a single test method or function.)</p> <p>Next, specify the location of the tests. The fields in this section are enabled depending on the test type selected in the Tests section.</p> <ul style="list-style-type: none"><li>- All tests in folder : for this testing scope, specify the following arguments:<ul style="list-style-type: none"><li>Folder : type the path to the directory that contains the tests to be executed, or click the browse button and select the desired directory in the Select Path dialog box.</li><li>Pattern : type the one or more patterns the file names should match for the files to be considered tests. Use comma as the delimiter. The patterns should be Python regular expressions.</li></ul></li><li>- Tests in script : for this scope, specify the name of the script that contains the tests to be executed.</li><li>- Tests class : for this scope, specify the name of the script and test class.</li><li>- Tests method : for this scope, specify the name of the script, test class and test method.</li><li>- Tests function : for this scope, specify the name of the script, and test method.</li></ul>
Environment variable	<p>Click the browse button, or press <code>Shift+Enter</code> to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click <code>+</code>, and type the desired name and value.</p>
Python Interpreter	
Interpreter options	<p>In this field, specify the string to be passed to the interpreter. If necessary, click <code>+</code>, and type the string in the editor.</p>
Working directory	<p>Specify a directory to be used by the running task.</p> <ul style="list-style-type: none"><li>- When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>- When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	<p>This field appears, if a remote interpreter has been selected in the field Python interpreter .</p> <p>Click the browse button <code>...</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code>/<code>-</code> buttons to create new mappings, or delete the selected ones.</p>
Add content roots to PYTHONPATH	<p>Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;</p>
Add source roots to PYTHONPATH	<p>Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;</p>
Docker container settings	<p><b>Warning!</b> This field only appears when <a href="#">Docker-based remote interpreter</a> has been selected for a project.</p> <p><b>Note</b> Speaking about the correspondence of settings with some options (<code>--net</code> , <code>--link</code> , etc.), note that these options come from <a href="#">Docker command line arguments</a> .</p> <p>Click <code>...</code> to open the dialog and specify the following settings:</p> <ul style="list-style-type: none"><li>- Disable networking : select this checkbox to have the networking disabled. This corresponds to <code>--net="none"</code> , which means that inside a container the external network resources are not available.</li><li>- Network mode : corresponds to the other values of the option <code>--net</code> .<ul style="list-style-type: none"><li>- <code>bridge</code> is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed though this bridge to the container.</li></ul></li></ul> <p>Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.</p> <ul style="list-style-type: none"><li>- <code>host</code> : use the host's network stack inside the container.</li><li>- <code>container:&lt;name id&gt;</code> : use the network stack of another container, specified via its name or id .</li></ul> <p>Refer to the <a href="#">Network settings</a> documentation for details.</p> <ul style="list-style-type: none"><li>- Links : Use this section to link the container to be created with the other containers. This is applicable to <code>Network mode = bridge</code> and corresponds to the <code>--link</code> option.</li><li>- Publish all ports : This corresponds to the option <code>--publish-all</code> .</li><li>- Port bindings : Use this field to specify the</li><li>- Extra hosts : This corresponds to the <code>--add-host</code> option. Refer to the page <a href="#">Managing /etc/hosts</a> for details.</li><li>- Volume bindings : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the <code>-v</code> option.</li></ul> <p>See <a href="#">Managing data in containers</a> for details.</p> <ul style="list-style-type: none"><li>- Environment variables : Use this field to specify the list of environment variables and their values. This corresponds to the <code>-e</code> option. Refer to the page <a href="#">ENV (environment variables)</a> for details.</li></ul>

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
	Select this check box to have the previous content of the selected log skipped.
	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.

This check box is not available when editing the run/debug configuration defaults.

Single instance only If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**Item**  
**Keyboard**  
**Description**  
**shortcut**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#).  
For more information, see [Configuring Synchronization with a Web](#)

Server and Uploading and Downloading Files .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for [Python unit tests](#) .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

#### Unittests

**Target** Click one of the radio-buttons to choose the possible target. The following choices are available: Python , Path , and Custom . The contents of the subsequent sections depend on the choice.

#### AvailableItemDescription for

**Python** In this text field, specify the path to test(s). For example, run everything from the module `my_tests` , included in the package `tests` :

```
tests.my_tests .
```

**Python** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

**Path** In this text field, specify the path to a file or folder to test everything in. For example,

```
C:/SampleProjects/py/MyPythonApp/Solver.py .
```

Note that when this target is selected, the browse button  appears to the right, allowing you to choose the path from the file system.

**Path** **Pattern** In this text field, specify the pattern that describes all the test in the required location.

**Path** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

**Custom** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

**Environment variable** Click the browse button, or press  to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click , and type the desired name and value.

#### Python Interpreter

**Interpreter options** In this field, specify the string to be passed to the interpreter. If necessary, click , and type the string in the editor.

**Working directory** Specify a directory to be used by the running task.

- When a default run/debug configuration is created by the keyboard shortcut , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.
- When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

**Path mappings** This field appears, if a remote interpreter has been selected in the field Python interpreter .

Click the browse button  to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use   buttons to create new mappings, or delete the selected ones.

**Add content roots to PYTHONPATH** Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

**Add source roots to PYTHONPATH** Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

**Warning!** This field only appears when **Docker-based remote interpreter** has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its `name` or `id`.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

**Target** Click one of the radio-buttons to choose the possible target. The following choices are available: Python , Path , and Custom . The contents of the subsequent sections depend on the choice.

#### AvailableItemDescription for

**Python** In this text field, specify the path to test(s). For example, run everything from the module `my_tests` , included in the package `tests` :

```
tests.my_tests .
```

**Python** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA.

**Python** **Keywords** In this text field, specify the keywords to search for the required tests. Refer to the [test name search documentation](#) for details.

**Path** In this text field, specify the path to a file or folder to test everything in. For example,

```
C:/SampleProjects/py/MyPythonApp/Solver.py .
```

Note that when this target is selected, the browse button  appears to the right, allowing you to choose the path from the file system.

**Path** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA.

**Custom** **Additional arguments** In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA.

**Environment variable** Click the browse button, or press `Shift+Enter` to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click `+` , and type the desired name and value.

### Python Interpreter

**Interpreter options** In this field, specify the string to be passed to the interpreter. If necessary, click  , and type the string in the editor.

**Working directory** Specify a directory to be used by the running task.

- When a default run/debug configuration is created by the keyboard shortcut `Ctrl+Shift+F10` , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.
- When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

**Path mappings** This field appears, if a remote interpreter has been selected in the field Python interpreter .

Click the browse button  to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use `+`/`-` buttons to create new mappings, or delete the selected ones.

**Add content roots to PYTHONPATH** Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

Add source roots to PYTHONPATH Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its `name` or `id`.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the <code>Gruntfile.js</code> where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the <code>grunt-cli</code> package.</li> <li>- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the <code>Gulpfile.js</code> where the required task is defined, select the task to execute, and specify the arguments</li> </ul>
---	---	---

to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for [Nose tests](#) .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Nosetests

Target Click one of the radio-buttons to choose the possible target. The following choices are available: Python , Path , and Custom . The contents of the subsequent sections depend on the choice.

#### AvailableItemDescription for

Python In this text field, specify the path to test(s). For example, run everything from the module `my_tests` , included in the package `tests` :

```
tests.my_tests .
```

Python Additional In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example arguments

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

Path In this text field, specify the path to a file or folder to test everything in. For example,

```
C:/SampleProjects/py/MyPythonApp/Solver.py .
```

Note that when this target is selected, the browse button  appears to the right, allowing you to choose the path from the file system.

Path Regex In this text field, specify the regex pattern that describes all the test in the Pattern required location. Files, directories, function names, and class names that match the specified regex pattern, are considered tests, for example `test.*`

Path Additional In this text field, specify the additional framework-specific arguments to be passed to the test as-is, for example arguments

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

Custom Additional In this text field, specify the additional framework-specific arguments to be argumentspassed to the test as-is, for example

```
--some-argument=some-value .
```

**Warning!** This option is not recommended and should only be used by the experts, who want to launch something not supported by IntelliJ IDEA

Environment variable Click the browse button, or press `Shift+Enter` to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click `+` , and type the desired name and value.

Python Interpreter

Interpreter options In this field, specify the string to be passed to the interpreter. If necessary, click  , and type the string in the editor.

Working directory Specify a directory to be used by the running task.

- When a default run/debug configuration is created by the keyboard shortcut `Ctrl+Shift+F10` , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.
- When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

Path mappings This field appears, if a remote interpreter has been selected in the field Python interpreter .

Click the browse button  to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use `+` / `-` buttons to create new mappings, or delete the selected ones.

Add content roots to PYTHONPATH Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

Add source roots to Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click  to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its `name` or `id`.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

Alt+Up or  
Alt+Down

Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder

Use this button to [create a new folder](#) . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members. If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate .xml file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration**. For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

**Warning!** The following is only valid when Python Plugin is installed and enabled!

Use this dialog box to create a run/debug configuration for [attests](#) .

In this section:

- [Configuration tab](#)
- [Toolbar](#)

## Configuration tab

### ItemDescription

Type	Click one of the radio-buttons to define the testing scope (all tests in a folder, all tests in a script, a test class, a single test method or function.)
Tests	Specify the location of the tests. The fields in this section are enabled depending on the test type selected in the Type section.
Environment variable	Click the browse button, or press <code>Shift+Enter</code> to specify the desired set of environment variables in the Environment Variables dialog box. To create a new variable, click <code>+</code> , and type the desired name and value.
Python Interpreter	
Interpreter options	In this field, specify the string to be passed to the interpreter. If necessary, click <code>+</code> , and type the string in the editor.
Working directory	Specify a directory to be used by the running task. <ul style="list-style-type: none"><li>– When a default run/debug configuration is created by the keyboard shortcut <code>Ctrl+Shift+F10</code> , or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.</li><li>– When this field is left blank, the <code>bin</code> directory of the IntelliJ IDEA installation will be used.</li></ul>
Path mappings	This field appears, if a remote interpreter has been selected in the field Python interpreter .  Click the browse button <code>...</code> to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use <code>+</code> / <code>-</code> buttons to create new mappings, or delete the selected ones.
Add content roots to PYTHONPATH	Select this check box to add all <a href="#">content roots</a> of your project to the environment variable PYTHONPATH;
Add source roots to PYTHONPATH	Select this check box to add all <a href="#">source roots</a> of your project to the environment variable PYTHONPATH;

### Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net` , `--link` , etc.), note that these options come from [Docker command line arguments](#) .

Click `...` to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"` , which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net` .
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:<name|id>` : use the network stack of another container, specified via its name or id .

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all` .
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- **Environment variables** : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click `▼` to expand the tables. Click `+` , `-` or `↻` to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.i.pr</code> file for shared configurations, or in the <code>.i.ws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each

runner will start in its own tab of the Run tool window.

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**Item**  
**Keyboard shortcut**  
**Description**

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
    - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
    - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
  - Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#). For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this run/debug configurations to execute Rack applications in the specified environment.

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)
- [Rack](#)

## Configuration tab

### ItemDescription

Server	Select the server to run or debug your application on.
IP Address	Specify the IP address where the server will be accessible.
Port	Specify the port to listen to.
Rack config file	Specify here the path to the Rack configurations file.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.
Run browser	If this checkbox is selected, a new tab will be added to your system default browser, where the application will be run or debugged. You can specify the required URL in the text field below, or use the one suggested by IntelliJ IDEA. Note that the default URL is automatically composed on the base of the IP address and port specified above.  If this checkbox is not selected, you have to launch the required browser manually.
Start JavaScript debugger automatically	If this checkbox is selected, the JavaScript debugger will be enabled. <b>Warning!</b> JavaScript debugging is available for Firefox and Chrome.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
-----------------------------	---

Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .

Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
----------------------------------	--

Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
---	---

	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
---	---

	Click this button to delete the selected pattern from the list.
---	---

	Click this button to change the selected code coverage pattern.
---	---

Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
------------------------------------	---

Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
----------------------------------	---

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.  
Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server: <ul style="list-style-type: none"> <li>– If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li> <li>– If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li> <li>– If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li> <li>– If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li> </ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .

	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"> <li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is</li> </ul>
---	---	--

specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<input type="checkbox"/>		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

---

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Rails run/debug configurations enable you to execute Rails applications in the selected environment.

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Trinidad and Torquebox notes](#)
- [Unicom note](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)

## Configuration tab

### ItemDescription

Server	Select the Rails server to run or debug your Rails application on. The list of available servers includes: <ul style="list-style-type: none"><li>- GlassFish</li><li>- Mongrel</li><li>- Webrick</li><li>- Lighttpd</li><li>- Passenger</li><li>- Puma</li><li>- Thin</li><li>- <a href="#">TorqueBox</a></li><li>- <a href="#">Trinidad</a></li><li>- <a href="#">Unicorn</a></li><li>- <a href="#">Zeus</a></li></ul>
--------	--

## Trinidad and Torquebox notes

Both [Trinidad](#) and [TorqueBox](#) servers require the following prerequisites to be met:

- JRuby 1.7.x is specified as the [project interpreter](#) .
- If you are going to debug Rails applications under these servers:
  - add to the [Gemfile](#) the dependency

```
gem 'ruby-debug-base', '>= 0.10.5.rc10'  
  
gem 'ruby-debug-ide', '>= 0.4.23.beta10'
```

- Make sure to increase Debug connection timeout up to 20-25 seconds [Settings | Debugger | Ruby](#) .
- If you are going to run Rails applications under these two servers, add the following dependencies to the [Gemfile](#) :

```
gem 'torquebox'
```

for [TorqueBox](#) ;

```
gem 'trinidad'
```

for [Trinidad](#) .

## Unicorn note

Note that unicorn kills worker processes that are taking too long to respond. To avoid error messages, add the following lines to the unicorn configuration file `unicorn.rb` :

```
if ENV[ 'IDE_PROCESS_DISPATCHER' ]
  timeout 30 * 60 * 60 * 24
end
```

IP Address	Specify the IP address where the Rails server will be accessible.
Port	Specify the port to listen to.
Server arguments	Type optional server arguments.
Environment	Select one of the Rails environments from the drop-down list (development, production, or test).
Dummy app	This field is only enabled for the Rails mountable engine projects . Specify here the absolute path to the <code>dummy</code> directory, or click the browse button and locate the desired path in the <a href="#">Select Working Directory</a> dialog box. This path is required to run the engine.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.
Run browser	If this checkbox is selected, a new tab will be added to your system default browser, where the application will be run or debugged. You can specify the required URL in the text field below, or use the one suggested by IntelliJ IDEA. Note that the default URL is automatically composed on the base of the IP address and port specified above.  If this checkbox is not selected, you have to launch the required browser manually.
Start JavaScript debugger automatically	If this checkbox is selected, the JavaScript debugger will be enabled. <b>Warning!</b> JavaScript debugging is available for Firefox and Chrome.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
-----------------------------	---

Sampling	Select this option to measure code coverage with minimal slow-down.
----------	---

Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
---------	---

Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.
-------------------------	---

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.
----------------------------------	--

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data

Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

Click this button to delete the selected pattern from the list.

Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime

Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders.

If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one

This check box is only available for JRuby used as the project interpreter.

When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:

- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.
- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the `ng` argument.

If this check box is not selected, then the script is launched in a usual way, without Nailgun.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active

Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry

The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.

If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content

Select this check box to have the previous content of the selected log skipped.

Save console output to file

Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

Show console when a message is printed to standard output stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

Click this button to remove the selected log entry from the list.

Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

## ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li><li>– Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information,</li></ul>
---	---	--

see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration** .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for a Rake task .

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Logs tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)
- [Rake](#)

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Task name	Specify the name of the Rake task to be executed.
Task arguments	Specify the list of the arguments to be passed to the Rake task. The arguments should be separated with spaces.
Turn on invoke/execute tracing, enable full backtrace ( <code>--trace</code> )	Select this check box to turn on the standard Rake <code>--trace</code> option.
Do a dry run without executing actions ( <code>-dry-run</code> )	Select this check box to turn on the standard Rake <code>-dry-run</code> option.
Display the tasks and dependencies, then exit ( <code>--prereqs</code> )	Select this check box to turn on the standard Rake <code>--prereqs</code> option.
Attach test runner UI for frameworks	If a check box of a testing framework is selected, the respective test will be executed in the test runner UI of this testing framework.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li></ul>

- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.  
If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered <i>covered</i> if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

Important note for RSpec 2.0 :

If recording code coverage has been enabled, and the check box RSpec has been selected in the Attach test runner UI for frameworks section of the [Configuration tab](#) , the following line should be added to rspec rake task:

```
t.rcov_opts = ENV["RCOV_OPTS"]
```

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	<p>This check box is only available for JRuby used as the project interpreter.</p> <p>When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:</p> <ul style="list-style-type: none"><li>– If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>– If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li></ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	<p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are

performed in the order they appear in the list.

#### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#).  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Use this dialog to create a debug configuration to be used for remote debugging processes (e.g. applications, servlets, plugin applets). Remote debugging enables you to connect to a running JVM.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Command line arguments for running remote JVM	These read-only fields show the command-line arguments to be used for running a remote JVM. IntelliJ IDEA suggests two arguments, depending on the JDK version used.
Transport: Socket	If the Socket transport is selected, specify host where the remote process is running and to which the debugger will connect. Specify also the port on remote host to which the debugger should connect.
Transport: Shared Memory	Having selected Shared memory transport, specify the shared memory address in the text field. This kind of transport is available for Windows only.
Debugger mode: Attach	Select this radio button if you want the debugger to connect to a running remote JVM.
Debugger mode: Listen	Select this radio button if you want the debugger to run as a server for remote JVMs which will connect to it to perform debugging. In this case the Host field will be disabled (if the Socket transport is selected). The Port value is considered as a port at which the debugger-"server" will listen to connections from the debugger-"clients".

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

	<p>Move into new folder / Create new folder</p> <p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	<p>Sort configurations</p> <p>Click this button to sort configurations in alphabetical order.</p>

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

 Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with. Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the

- Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | Resin | Local or Remote

Resin [run/debug configurations](#) let you deploy and debug your applications on [Resin](#) . (The Resin Integration [plugin](#) must be enabled.)

- [Name field and Share option](#)
- [Server tab for a local configuration](#)
- [Server tab for a remote configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab for a remote configuration](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Working with Server Run/Debug Configurations](#) .

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  (Shift+Enter) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> OR <code>"some arg"</code> .</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="quoted_value"</code> .</li></ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li><li>- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.</li></ul>

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
Resin configuration template	Specify the location of the Resin configuration template. You can click  and select the necessary file in the <a href="#">dialog that opens</a> .
Additional Resin command line	If necessary, specify additional commands for the server. If you need more room to type, click  next to the field to open the Additional Resin command line dialog where the text entry area is larger.
Do not alter Resin configuration	Select this checkbox to disallow editing the Resin configuration file.
Charset	Specify the character set to be used.
JMX port	Specify the JMX server port.
Deploy mode	Select the deploy-mode (startup-mode) for applications on the server.
HTTP port	The server HTTP port. You may want to change the default port <code>80</code> (e.g. to <code>8080</code> ).

## Server tab for a remote configuration

### ItemDescription

---

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click <a href="#">Configure</a> to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <code>Shift+Enter</code> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> ) in the Run or Debug tool window). The options are: <ul style="list-style-type: none"><li>– Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li><li>– Redeploy. The application artifact is rebuilt and redeployed.</li></ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
Charset	Specify the character set to be used.
JMX port	Specify the JMX server port.
Ping	Click this button to ping the JMX port on the server.
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: <ul style="list-style-type: none"><li>– Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host.</li></ul>

- ftp. The [File Transfer Protocol](#) or [Secure FTP](#) is used.
- Local or mounted folder. The staging environment is a local folder or is accessed as a [mounted folder](#) .

If the list is empty, you have to [enable the Remote Hosts Access plugin](#) which supports the corresponding functionality.

**Host** If Same file system is selected for Type , the only available option for Host is also Same file system . In all other cases, the list contains the existing configurations of the selected type . So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.

Select an existing configuration or create a new one.

To create a new configuration:

1. Click  to the right of the list.
2. In the [Deployment dialog](#) , click .
3. In the Add Server dialog, specify the configuration name, select the type, and click OK .
4. On the [Connection tab](#) , specify the settings in the Upload/download project files section. The rest of the settings don't matter.
5. Click OK in the Deployment dialog.

**Path from root** The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.

Note that if Same file system is selected for Type and Host , this setting doesn't need to be specified.

**Remote connection settings** The settings for accessing deployed applications.

**Host** The fully qualified domain name or the IP address of the Resin host.

**Port** The server HTTP port.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:` .
- The folder that you are going to use for staging is `C:\shared\staging` .

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Path from root: `staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use  . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

 or  Use this icon or shortcut to add an artifact or an external resource to the list.

- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

 or  Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 or  Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

**Deployment method** For local configurations: select the deployment method for the selected artifact or external resource ( JMX or resin.xml ).

**Resin host name** For local configurations: specify the name or the IP address of the Resin host (for example, `localhost` or `127.0.0.1` ).

**Use default context name** For local configurations: select this checkbox if you want to use the default [context root](#) for the selected artifact or external resource. Otherwise, clear this checkbox and specify the context root in the Application context name field. Note that if the deployment method is JMX, the default context root is always used.

**Application context name** For local configurations: specify the context root for the selected artifact or external resource.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li></ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

	 Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ</li></ul>
---	--

IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to build an [artifact](#) or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.
- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

 You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.

To remove grouping, select a folder and click  .

See also, [Creating Folders and Grouping Run/Debug Configurations](#) .

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for a RSpec test.

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Logs tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)
- [RSpec](#)

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Mode	Click one of the radio buttons to define the scope of tests to be performed: <ul style="list-style-type: none"><li>– All specs in a folder : Click this radio button, if you want to run all tests in a directory.</li><li>– Spec script : Click this radio button, if you want to run the specified test script.</li></ul>
All specs in folder	Click this radio button, if you want to run all tests in a directory.
Specs folder	Specify the fully qualified path to the directory that contains the desired specs, or click <input type="button" value="..."/> and select the specs directory in the <a href="#">dialog that opens</a> . This field is only available, when the All specs in folder option is selected.
File name mask	Specify the mask of the spec file name, for example, <code>**/*_spec.rb</code> . This field is only available, when the All specs in folder option is selected.
Spec script	Specify the name of the script to be executed.  This field is only available, when the Spec script option is selected.
Example name	Specify the name of the example within the script to be executed. If no example is specified, all examples will be executed.  This field is only available, when the Spec script option is selected.
Runner options	Enter runner options ( <code>spec --help</code> ).
'rspec' gem	Use this drop-down list to select the desired gem version, which will be used to run the tests. The list shows the versions that are available in the Ruby SDK. By default, the latest available version is taken.
Use custom RSpec runner script	Select this checkbox if you want to use an alternative spec runner. You can type the fully qualified path to the spec runner in the text field, or click <input type="button" value="..."/> , and select the desired runner in the <a href="#">dialog that opens</a> .
Use pre-loaded server	From the drop-down list, select the server to be used for executing scripts or examples.  Select None if you want to execute a test script or example locally, without any server.  <b>Tip</b> If both Zeus and Spork DRb servers are running simultaneously, it is Zeus that gets priority.  If a pre-loaded server is already running, it will be selected from the drop-down list.  Refer to <a href="#">Executing Tests on DRb Server</a> or <a href="#">Executing Tests on Zeus Server</a> for details.
Output full backtrace	Select this check box to enable the <code>--trace</code> option.
Working	Specify the current directory to be used by the running task. By default, the project directory is used as a working

directory	directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered <i>covered</i> if it is covered at least once.
Packages and classes to record	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

## code coverage

	<p>Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.</p> <p>The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .</p> <p>Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.</p>
	<p>Click this button to delete the selected pattern from the list.</p>
	<p>Click this button to change the selected code coverage pattern.</p>
Do not use the optimized C runtime	<p>Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.</p>
Enable coverage in test folders.	<p>If this check box is selected, the folders marked as test  are included in the code coverage analysis.</p> <p>Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .</p> <p>If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section <a href="#">Code Coverage</a> for details.</p>

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	<p>This check box is only available for JRuby used as the project interpreter.</p> <p>When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:</p> <ul style="list-style-type: none"><li>- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li></ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	<p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.</p> <p>Move run/debug configurations to a folder using drag-and-drop, or the  buttons.</p>
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	<p>In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.</p>
Defaults	<p>This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.</p>
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p>

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

Item	Keyboard shortcut	Description
------	-------------------	-------------

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application

files automatically uploaded to the server according to the default server access configuration .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for a Ruby script .

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Ruby script	Specify the fully qualified path to a Ruby script to be executed, or click  , and select the desired Ruby script in the <a href="#">dialog that opens</a> .
Script arguments	Type the optional arguments to be passed to the Ruby script.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	<p>Specify the arguments to be passed to the Ruby interpreter.</p> <p>Note that when JRuby is used as the <a href="#">project interpreter</a> , the list of Ruby arguments can include <a href="#">Nailgun</a> argument <code>--ng</code> .</p> <p>So doing, when such a run/debug configuration is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:</p> <ul style="list-style-type: none"><li>- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>--ng</code> argument.</li></ul> <p>Classpath property is added to Nailgun settings.</p>
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code	Select the desired code coverage runner.
-------------	--

coverage runner	By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.  <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.  <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.
Use bundled coverage.py	If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .  If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section <a href="#">Code Coverage</a> for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server: <ul style="list-style-type: none"> <li>– If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li> <li>– If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li> <li>– If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li> <li>– If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li> </ul> <p>If this check box is not selected, then the script is launched in a usual way, without Nailgun.</p>
--	--

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li> </ul>

Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: - Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not
---	---	---

defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#) .

- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.

- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#) .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.

Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

- [Ruby on Rails](#)

## Information and settings

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Server command	Use the following command on the server side to enable remote debug: <pre>rdebug-ide --host 0.0.0.0 --port &lt;port number&gt; --dispatcher-port &lt;port number&gt; -- \$COMMAND\$</pre> <p>This read-only field shows the command that should be entered on the server side to launch the debug server. Port and dispatcher-port numbers here are taken from the Port and Local port fields. <code>\$COMMAND\$</code> corresponds to the name of the script to be debugged.</p>
Remote host	Specify URL of the host where remote debugging will take place.
Remote port	Specify the port number on the server side. Note that the number entered in this field, is automatically used in the <code>rdebug</code> command. As you type port number, the suggested command string changes accordingly.
Remote root folder	Specify the root directory on the server side, where the script to be debugged is located. This field defines mapping to the local root folder.
Local port	Specify the local port number. Note that the number entered in this field, is automatically used in the <code>rdebug</code> command. As you type the local port number, the suggested command string changes accordingly.
Local root folder	Specify the local root directory containing the script in question. Type the path, or click  and find the desired root in the Select Path dialog box.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort	Click this button to sort configurations in alphabetical order.

If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
  - Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
  - Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the

Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the **default server access configuration**. For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

IntelliJ IDEA lets you specify a run/debug configuration for SBT tasks.

## ItemDescription

### Tasks

VM parameters

If necessary, specify the string to be passed to the VM.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m`.
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` Or `"some arg"`.
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value\"`.

If there is not enough space, you can click  and enter the string in the dialog that opens.

Environment variables

Click  to open the Environment Variables dialog box where you can create variables and specify their values.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not</li></ul>
---	---	--

defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#) .

- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.

- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<input type="checkbox"/>		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<input type="checkbox"/>		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be

activated automatically when you run/debug your application. This option is enabled by default.

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

## Configuration tab

### ItemDescription

**Main class** In this text box, specify the fully qualified name of the class to be executed (passed to the JRE). Type the class name manually or click the Browse button  to open the Choose Main Class dialog box, where you can find the desired class by name or search through the project.

**VM options** In this text box, specify the string to be passed to the VM for launching an application. Usually this string contains the options such as `-mx` , `-verbose` , etc. If necessary, click  and type the desired string in the VM Options dialog.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

The `-classpath` option specified in this field overrides the classpath of the module.

**Program arguments** In this text box, type a list of arguments to be passed to the program in the format you would use in the command line. If necessary, click the  button and type the desired arguments in the Program Parameters dialog box. Use the same rules as for specifying the [VM options](#) .

**Working directory** In this text box, specify the current directory to be used by the running application. This directory is the starting point for all relative input and output paths. By default, the field contains the directory where the project file resides. To specify another directory, click the Browse button  select the directory in the [dialog that opens](#) . Click this  icon to view the list of available [path variables](#) that you can use as a path to your working directory.

**Note** The list of the path variables may vary depending on the enabled plugins.

**Environment variables** Click the Browse button  to open the Environment Variables dialog box, where you can create variables and specify their values. Note that you can copy-paste the contents of the Environment variables field without having to open the Environment Variables dialog box.

**Use classpath of module** Select the module whose classpath should be used to run the application.

**JRE** By default, the newest JDK from the module dependencies is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.

**Enable capturing form snapshots** Select this check box to enable the [GUI Designer](#) to [take snapshots of the GUI components](#) , that can be afterwards converted into a form.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.  Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .  If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section <a href="#">Code Coverage</a> for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li> </ul>
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug

new folder configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members. If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to

execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

## Configuration tab

### ItemDescription

**Test kind** From this drop-down list, select the scope for your tests and fill in the fields depending on your selection.

You can choose from the following options:

- **Test name** - select this option to run the specified Scala test. The name of the test appears in the Test Name field.
- **All in package** - select this option to run all Scala tests in the specified package.

Fill in the following fields:

- **Test Package** - specify the name of the package to be tested.
- **Search for tests** - use this drop-down list to select the scope of your search.

- **Class** - select this option to run all tests in a class.

Specify the fully qualified name of the class to be launched in the Test Class field. Type the class name or click  and select the desired class in the dialog that opens.

**VM parameters** If necessary, specify the string to be passed to the VM. When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value\"` .

If there is not enough space, you can click  and enter the string in the dialog that opens.

**Environment variables** Click  to open the Environment Variables dialog box where you can create variables and specify their values.

**Test options** Use this field to specify the additional test options. If there is not enough space, you can click  and enter the string in the dialog that opens.

**Working Directory** Specify the directory that will act as the current directory when running the test. It will act as the root directory for all relative input and output paths. By default, the directory where the project file resides, is used as a working directory. Type directory name, or click  and select the desired directory in the dialog that opens.

**Use classpath and SDK of module** From this drop-down list, select the module whose classpath will be used to run the application.

**Print information messages to console** Select this checkbox if you want to print information messages to the Scala console.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data

Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

Click this button to delete the selected pattern from the list.

Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime

Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders

If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active

Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry

The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content

Select this check box to have the previous content of the selected log skipped.

Save console output to file

Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

Show console when a message is printed to standard output stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

Click this button to remove the selected log entry from the list.

Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

  Click this button to add a new configuration to the list.

  Click this button to remove the selected configuration from the list.

  Click this button to create a copy of the selected configuration.

 Edit defaults

Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

  or  Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

 Move into new folder / Create new folder

Use this button to [create a new folder](#) . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

IntelliJ IDEA lets you specify a Run/Debug configuration for [Specs2](#) .

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

## Configuration tab

### ItemDescription

**Test kind** From this drop-down list, select the scope for your tests and fill in the fields depending on your selection.

You can choose from the following options:

- **Test name** - select this option to run the specified Scala test. The name of the test appears in the Test Name field.
- **All in package** - select this option to run all Scala tests in the specified package.

Fill in the following fields:

- **Test Package** - specify the name of the package to be tested.
- **Search for tests** - use this drop-down list to select the scope of your search.
- **Class** - select this option to run all tests in a class.

Specify the fully qualified name of the class to be launched in the Test Class field. Type the class name or click  and select the desired class in the dialog that opens.

**VM parameters** If necessary, specify the string to be passed to the VM.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

If there is not enough space, you can click  and enter the string in the dialog that opens.

**Environment variables** Click  to open the Environment Variables dialog box where you can create variables and specify their values.

**Test options** Use this field to specify the additional test options.

If there is not enough space, you can click  and enter the string in the dialog that opens.

**Working Directory** Specify the directory that will act as the current directory when running the test. It will act as the root directory for all relative input and output paths. By default, the directory where the project file resides, is used as a working directory.

Type directory name, or click  and select the desired directory in the dialog that opens.

**Use classpath and SDK of module** From this drop-down list, select the module whose classpath will be used to run the application.

**Print information messages to console** Select this checkbox if you want to print information messages to the Scala console.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner.

By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

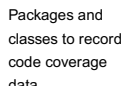

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with previous results** When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

	<p>Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.</p>
	<p>Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.</p> <p>The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .</p> <p>Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.</p>
	<p>Click this button to delete the selected pattern from the list.</p>
	<p>Click this button to change the selected code coverage pattern.</p>
<p>Do not use the optimized C runtime</p>	<p>Select this check box to enable the option <code>--no-rcovrte</code> . Use this option with discretion, since it significantly slows down performance.</p>
<p>Enable coverage in test folders.</p>	<p>If this check box is selected, the folders marked as test  are included in the code coverage analysis.</p> <p>Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled <code>coverage.py</code> .</p>

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter. Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

<p>Is Active</p>	<p>Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .</p>
<p>Log File Entry</p>	<p>The read-only fields in this column list the log files to show. The list can contain:</p> <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> <p>If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</p>
<p>Skip Content</p>	<p>Select this check box to have the previous content of the selected log skipped.</p>
<p>Save console output to file</p>	<p>Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .</p>
<p>Show console when a message is printed to standard output stream</p>	<p>Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.</p>
<p>Show console when a message is printed to standard error stream</p>	<p>Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.</p>
	<p>Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.</p>
	<p>Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .</p>
	<p>Click this button to remove the selected log entry from the list.</p>
	<p>Click this button to edit the select log file entry. The button is available only when an entry is selected.</p>

## Toolbar

### ItemShortcutDescription

	<p> Click this button to add a new configuration to the list.</p>
	<p> Click this button to remove the selected configuration from the list.</p>
	<p> Click this button to create a copy of the selected configuration.</p>
	<p><b>Edit defaults</b></p> <p>Click this button to edit the default configuration templates. The defaults are used for newly created configurations.</p>
	<p> or  Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.</p>
	<p><b>Move into new folder / Create</b></p> <p>Use this button to <a href="#">create a new folder</a> .</p> <p>If one or more run/debug configurations are in focus, the selected run/debug</p>

new folder configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to

execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Spork DRb run/debug configuration is created as a temporary one on [launching the Spork DRb server](#) . You can change settings as required, assign a name, save this configuration as permanent, and further use it to run Spork DRb server.

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)

## Configuration tab

### ItemDescription

Spork script	When the run/debug configuration is created by the Tools   Run SporkDRb server command, this field points to the <code>spork</code> script under the current Java interpreter.  If you are creating the configuration from scratch, specify the fully qualified path to script.
Test framework	Click one of the radio buttons to select the desired testing framework.
Additional arguments	Type additional parameters to be passed to the <code>spork</code> script.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,

coverage

 becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results

When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data

Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

Click this button to delete the selected pattern from the list.

Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime

Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders.

If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one

This check box is only available for JRuby used as the project interpreter.

When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:

- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.
- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the `ng` argument.

If this check box is not selected, then the script is launched in a usual way, without Nailgun.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active

Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry

The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
  - [Ant patterns](#) that define the range of files to be displayed.
  - Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.
- If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content

Select this check box to have the previous content of the selected log skipped.

Save console output to file

Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

Show console when a message is printed to standard output stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream

Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea/runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea/workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"> <li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the</li> </ul>
---	---	--

compilation result.

- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#) .

- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.

- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.

- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.

For more information, see [Maven](#) .

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default [server access configuration](#) .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.

Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Use this dialog box to create configurations used to run or debug [Spring Boot](#) applications.

This dialog box consists of the following areas:

- [Configuration tab](#)
- [Logs tab](#)
- [Before launch options](#)

## Configuration tab

Use this tab to configure general run/debug configuration settings, and the specific Spring Boot settings.

### ItemDescription

Main class	In this text box, specify the fully qualified name of the class to be executed (passed to the JRE). Enter the class name manually or click the Browse button  and search for the desired class by name or through the project.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\\"quoted_value\"</code> .</li></ul>
Program arguments	Enter a list of arguments to be passed to the program in the format you would use in the command line. If there is not enough space, click the  button and enter the parameters in the Program Parameters dialog box. Use the same rules as for specifying the <a href="#">VM options</a> .
Working directory	If necessary, specify a directory to be used by the running text. This directory is the starting point for all relative input and output paths. By default, this is the project directory. To specify a different directory, click the Browse button  and select a directory in the <a href="#">dialog that opens</a> .
Environment variables	Click the Browse button  to open the Environment Variables dialog where you can create variables and specify their values.
Use classpath of module	Select the module whose classpath will be used to run the application.
JRE	By default, the newest JDK from the module dependencies is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
Enable debug output	Select this option to enable logging of the debug output.
Hide Banner	Select this option to hide the startup banner printed by Spring Boot when starting a run/debug session.
Active Profiles	If necessary, specify active <a href="#">Spring profiles</a> that you want to use in this run/debug configuration.
Override parameters	Use this table to specify which Spring Boot configuration parameters you want to override. Such parameters are normally defined in configuration files. Listing them in a run/debug configuration allows you to easily switch parameters by modifying the run/debug configuration instead of config files, or have multiple run/debug configurations with different parameter values. When you add a new parameter and start typing its name, IntelliJ IDEA provides content completion and displays a list of parameters that match the string you've entered. Use the following controls: <ul style="list-style-type: none"><li>–  : use the checkboxes in the Enabled column to select which parameters you want to override. You can simply deselect the parameters you do not need to override at the moment without removing them and losing their values.</li><li>–  : click this icon to add a parameter you want to override to the list.</li><li>–  : click this icon to remove a parameter from the list.</li><li>–  : click these icons to move the selected parameter up or down in the list.</li></ul>

## Logs tab

Use this tab to specify which log files generated while running or debugging must be displayed in the console, that is in the dedicated tabs of the [Run tool window](#) and the [Debug tool window](#) .

### ItemDescription

Is active	Select checkboxes in this column to have the corresponding log entries displayed in the <a href="#">Run tool window</a> and the <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to be shown. This list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed</li><li>– Aliases that substitute full paths or patterns. These aliases are also displayed in the tab headers where the corresponding log files are shown. Note that if a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.</li></ul>
Skip Content	Select the checkboxes in this column to skip the previous contents of the selected log.
Save console output to file	Select this option to save the console output to a specified location. Type the path manually, or click the Browse button  and select a location in the <a href="#">dialog that opens</a> .
Show console when standard out changes	Select this option to activate the output console and bring it forward if the associated process is writing to Standard.out.

	Select this option to activate the output console and bring it forward if the associated process is writing to Standard.err.
	Click this button to add a new log file entry. Specify the associated properties in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. This button only appears when an entry is selected.

## Before launch options

Use this section to specify which tasks must be carried out before starting the run/debug session. The tasks you specify will be performed in the order that they appear in the list.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select from the following task types: <ul style="list-style-type: none"> <li>– Run External tool : select this option to run an application that is external to IntelliJ IDEA. Select the application(s) you want to run in the dialog that opens. If the required application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> <li>– Make : select this option to compile the project or module. If a particular module is specified in the run/debug configuration, the <a href="#">Make Module</a> command will be executed. Otherwise, the <a href="#">Make Project</a> command will be performed.</li> <li>– Make, no error check : the same as the Make option, but IntelliJ IDEA will try to launch the run/debug session irrespective of the compilation result.</li> <li>– Build Artifacts : select this option to build one or several artifacts. Select the artifacts you want to build in the dialog that opens. For more information, see <a href="#">Working with Artifacts</a>.</li> <li>– Run Another Configuration : select this option to have a different run/debug configuration executed first. Select the configuration that you want to run in the dialog that opens. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>– Make Project : select this option to compile all files that have been modified since the last compilation, and dependent source files.</li> <li>– Run Ant target : select this option to run an Ant target. Select the target you want to run in the dialog that opens. For more information, see <a href="#">Ant</a>.</li> <li>– Run Gradle task : select this option to run a Gradle task. In the dialog that opens, specify the Gradle project, the tasks you want to run, and, if necessary the VM options and script parameters. For more information, see <a href="#">Gradle</a>.</li> <li>– Generate CoffeeScript Source Maps : select this option to generate the source maps for your CoffeeScript sources. Specify where your CoffeeScript source files are located in the dialog that opens. For more information, see <a href="#">CoffeeScript Support</a>.</li> <li>– Run Maven Goal : select this option to run a Maven goal. Select the goal you want to run in the dialog that opens. For more information, see <a href="#">Maven</a>.</li> <li>– Run Remote External tool : select this option to run a remote application external to IntelliJ IDEA. Select the remote application(s) you want to run in the dialog that opens. If the required application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li> </ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list.
Show this page	N/A	Select this checkbox to show the run/debug settings before starting a run/debug session.

This feature is only supported in the Ultimate edition.

In this part:

- [Run/Debug Configuration: Spring DM Server \(Local\)](#)
- [Run/Debug Configuration: Spring DM Server \(Remote\)](#)

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | Spring dmServer | Local

Spring dmServer [run/debug configurations](#) let you deploy and debug your applications on [SpringSource dm Server](#) and [Virgo](#). (The dmServer Support [plugin](#) must be enabled.)

Note that if you are starting the server by means of the default script `startup.bat` or `startup.sh`, you should properly set the environment variable `JAVA_HOME`.

- [Name field and Share option](#)
- [Server tab for a local configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab for a local configuration](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Working with Server Run/Debug Configurations](#).

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)  If the message <i>Error: JMX arguments are incompatible with IDEA</i> is shown in the lower part of the dialog, click Fix. As a result, the necessary changes are made to the script <code>bin/dmk.bat</code> or <code>dmk.sh</code> .
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  ( <code>Shift+Enter</code> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code>.</li></ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <code>Ctrl+F10</code> in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed</li></ul>

classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.

- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
Port	Specify the HTTP server port.
JMX Port	Specify the JMX server port.
JMX User	Specify the name of the user on whose behalf IntelliJ IDEA will connect to the JMX server port.
JMX Password	Specify the password of the <a href="#">JMX user</a> .
Local staging / Repository target	Select the watched repository to place your plans (artifacts) to.

---

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use [+](#) . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

---

 or 	Use this icon or shortcut to add an artifact or an external resource to the list. <ul style="list-style-type: none"><li>- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.</li><li>- To add an external resource, select External Source and choose the location of the desired resource in the <a href="#">dialog that opens</a> .</li></ul>
 or 	Use this icon or shortcut to remove the selected artifacts and external resources from the list.
 or 	Use this icon or shortcut to configure the selected artifact. (The <a href="#">Artifacts page</a> of the <a href="#">Project Structure dialog</a> will open.)

---

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

---

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>- Full paths to specific files.</li><li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li></ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.

---

 Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

 Click this button to remove the selected log entry from the list.

 Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.  To remove the classes or packages from the list, select the corresponding list items and click  .
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 Run / Use to switch between the settings for the run, debug and code coverage modes.

 Debug /

 Coverage

Startup script Specify the script to be used to start the server.  
Use default:

- If this checkbox is selected, the default script is used.
-  in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).
- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.

When specifying the parameters and options, follow these rules:

- Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

Shutdown script Specify the script to be used to stop the server.  
Use default:

- If this checkbox is selected, the default script is used.
-  in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).
- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.

When specifying the parameters and options, follow these rules:

- Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" Or "some arg"` .
- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

Pass environment variables To pass specific variables to the server environment, select this checkbox and specify the variables:

- To add a variable, click  and specify the variable name and value in the Name and Value fields respectively.
- To remove a variable from the list, select the variable and click  .

Port Use this field to change the debugger port.

Debugger Settings Click this button to edit the debugger options on the [Debugger page](#) of the [Settings dialog](#) .

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>– Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>– Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page	<input type="checkbox"/>	Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window	<input type="checkbox"/>	If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.  To remove grouping, select a folder and click  .  See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | Spring dmServer | Local or Remote

Spring dmServer [run/debug configurations](#) let you deploy and debug your applications on [SpringSource dm Server](#) and [Virgo](#). (The dmServer Support [plugin](#) must be enabled.)

Note that if you are starting the server by means of the default script `startup.bat` or `startup.sh`, you should properly set the environment variable `JAVA_HOME`.

- [Name field and Share option](#)
- [Server tab for a remote configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Startup/Connection tab for a remote configuration](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Working with Server Run/Debug Configurations](#).

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a remote configuration

### ItemDescription

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click <a href="#">Configure</a> to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> in the Run or Debug tool window). The options are: <ul style="list-style-type: none"><li>- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li></ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JMX Port	Specify the JMX server port.
Ping	Click this button to ping the JMX port on the server.
JMX User	Specify the name of the user on whose behalf IntelliJ IDEA will connect to the JMX server port.
JMX Password	Specify the password of the <a href="#">JMX user</a> .
Remote	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is

staging	provided after this table.
Type	<p>Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <i>connection type</i>.)</p> <p>The available options are:</p> <ul style="list-style-type: none"> <li>– Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host.</li> <li>– ftp. The <a href="#">File Transfer Protocol</a> or <a href="#">Secure FTP</a> is used.</li> <li>– Local or mounted folder. The staging environment is a local folder or is accessed as a <a href="#">mounted folder</a>.</li> </ul> <p>If the list is empty, you have to <a href="#">enable the Remote Hosts Access plugin</a> which supports the corresponding functionality.</p>
Host	<p>If Same file system is selected for Type, the only available option for Host is also Same file system.</p> <p>In all other cases, the list contains the existing configurations of the selected <i>type</i>. So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.</p> <p>Select an existing configuration or create a new one.</p> <p>To create a new configuration:</p> <ol style="list-style-type: none"> <li>1. Click  to the right of the list.</li> <li>2. In the <a href="#">Deployment dialog</a>, click .</li> <li>3. In the Add Server dialog, specify the configuration name, select the type, and click OK.</li> <li>4. On the <a href="#">Connection tab</a>, specify the settings in the Upload/download project files section. The rest of the settings don't matter.</li> <li>5. Click OK in the Deployment dialog.</li> </ol>
Deployment access	When deploying to the remote host, the application artifact or artifacts are placed into a staging folder (deployment target folder). This folder should be accessible to the server. The settings in this section define the location of this staging folder.
Path from root	The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.
Mapped as	The absolute path to the staging folder in the local file system of the remote host. The path should be specified as a URL, e.g. <p><code>file:///C:/shared/staging</code></p>
Repository access	When deploying to the remote host, the plans (artifacts) are placed into a watched repository. The settings in this section describe this repository.
Path from root	The path to the repository folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.
Name	Specify the name of the watched repository the way it is defined in the configuration of the remote server.
Remote connection settings	The settings for accessing deployed applications.
Host	The fully qualified domain name or the IP address of the server host.
Port	The server HTTP port.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:`.
- The folder that you are going to use for staging is `C:\shared\staging`.

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Staging/Path from root: `staging`
- Staging/Mapped as: `file:///C:/shared/staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup), use . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

-  or  Use this icon or shortcut to add an artifact or an external resource to the list.
  - To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.

- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

— or Use this icon or shortcut to remove the selected artifacts and external resources from the list.

or F4 Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

	Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li> <li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> </ul>
--	--

- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

	Alt+Delete	Click this icon to remove the selected task from the list.
	Enter	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	Alt+Up / Alt+Down	Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

	Alt+Insert	Create a run/debug configuration.
	Alt+Delete	Delete the selected run/debug configuration.
	Ctrl+D	Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
	Alt+Up / Alt+Down	Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		<p>You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.</p> <p>Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.</p> <p>To remove grouping, select a folder and click  .</p> <p>See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .</p>

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for tracing Web applications using the **Spy-js tool**.

On this page:

- [Getting access to the Run/Debug Configuration: Spy-js dialog](#)
- [Spy-js-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Spy-js dialog

1. Download and install [Node.js](#) because it is used by the **Spy-js** trace server.
2. **Install and enable** the **Spy-js** plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

## Spy-js-specific configuration settings

### ItemDescription

**Node interpreter** In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in [Configuring Node.js Interpreters](#).

If you have [appointed one of the installations as default](#), the field displays the path to its executable file.

With **Spy-js**, it is recommended to use Node.js version 0.10.24 or higher.

**Trace server port** In this spin box, specify the port on which **Spy-js** will act as a proxy server. This port number must be the same as your system proxy port. If the **Automatically configure system proxy** checkbox is selected, the specified port number is automatically set for the system proxy server. Otherwise you will have to specify the value of the field in the system proxy settings manually.

The **trace server port** is filled in automatically. To avoid port conflicts, it is recommended that you accept the suggested value and keep the **Automatically configure system proxy** checkbox selected.

**Use** In this drop-down list, specify the way to configure a tracing session.

- To have **Spy-js** apply its internal predefined configuration, choose **Default configuration**.
- To have your custom manually created configuration applied, choose the **Configuration file** option and then specify the location of your custom configuration file in the **Configuration** field below. A **configuration file** is a JavaScript file with the extension `.js` or `.conf.js` that contains valid JavaScript code that meets the [Spy-js configuration requirements](#). If IntelliJ IDEA detects files with the extension `.conf.js` in the project, these files are displayed in the drop-down list.

Type the path to the configuration file manually or click the **Browse** button  and choose the location in the dialog box that opens. Once specified, a configuration file is added to the drop-down list so you can get it next time from the list instead of specifying the path.

**URL to trace** In this field, specify the URL address of the Web page to capture events on. By default, the field is empty. This means that **Spy-js** captures events on all the currently opened Web pages. If you want to restrict the tracing to a certain page, specify its URL address. Type the address manually or choose it from the drop-down list, if it has been once specified in the configuration.

**Automatically configure system proxy**

- When this checkbox is selected, the system proxy server is activated automatically with the port specified in the **Trace server port** field.
- Clear this checkbox to specify proxy settings manually. See how to configure proxy settings manually on [Windows](#), [Mac](#), [Ubuntu](#), [iOS](#), [Android](#), [Windows Phone](#). Please note that some desktop browsers have their own screens for proxy settings configuration.

The checkbox is selected by default, and it is strongly recommended that you accept this setting and have the proxy configured automatically.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) . For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

In this dialog box, create configurations for tracing **Node.js** applications using the **Spy-js tool** .

On this page:

- [Getting access to the Run/Debug Configuration: Spy-js for Node.js dialog](#)
- [Spy-js for Node.js-specific configuration settings](#)
- [Toolbar](#)
- [Common options](#)

## Getting access to the Run/Debug Configuration: Spy-js for Node.js dialog

1. Download and install [Node.js](#) because it is used by the Spy-js trace server.
2. **Install and enable** the Spy-js plugin. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the **JetBrains plugin repository** as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#) .

## Spy-js for Node.js-specific configuration settings

### ItemDescription

Node interpreter	<p>In this field, specify the Node.js interpreter to use. Choose one of the configured interpreters or click  and configure a new one as described in <a href="#">Configuring Node.js Interpreters</a> .</p> <p>If you have <a href="#">appointed one of the installations as default</a> , the field displays the path to its executable file.</p> <p>With Spy-js, it is recommended to use Node.js version 0.10.24 or higher.</p> <p>To enable tracing <a href="#">ECMAScript 6</a> scripts, use Node.js version 0.11.13 or higher and specify <code>--harmony</code> as a Node parameter.</p>
Node parameters	<p>In this text box, type the Node.js-specific command line options to be passed to the NodeJS executable file. For example, to enable tracing <a href="#">ECMAScript 6</a> scripts, specify <code>--harmony</code> as a Node parameter. Note that Node.js must be version 0.11.13 or higher.</p>
Working directory	<p>In this field, specify the <a href="#">working directory</a> of the application. All references in the starting Node.js application file , for example, <code>imports</code> , will be resolved relative to this folder, unless such references use full paths.</p> <p>By default, the field shows the <code>project root folder</code> . To change this predefined setting, choose the desired folder from the drop-down list, or type the path manually, or click the Browse button  and select the location in the dialog box, that opens.</p>
JavaScript file	<p>In this field, specify the full path to the file to start running the application from.</p> <p>If you are going to trace CoffeeScript, specify the path to the generated JavaScript file. The file can be generated externally or through compilation using file watchers. For more details, see <a href="#">Compiling CoffeeScript to JavaScript</a> .</p>
Application parameters	<p>In this text box, type the Node.js-specific arguments to be passed to the application start file through the <a href="#">process.argv</a> array.</p>
Environment variables	<p>In this field, specify the <a href="#">environment variables</a> for the Node.js executable file, if applicable. Click the Browse button  to the right of the field and configure a list of variables in the Environment Variables dialog box, that opens:</p> <ul style="list-style-type: none"><li>– To define a new variable, click the Add toolbar button  and specify the variable name and value.</li><li>– To discard a variable definition, select it in the list and click the Delete toolbar button  .</li><li>– Click OK , when ready</li></ul> <p>The definitions of variables are displayed in the Environment variables read-only field with semicolons as separators. The acceptable variables are:</p> <ul style="list-style-type: none"><li>– <code>NODE_PATH</code> : A  -separated list of directories prefixed to the module search path.</li><li>– <code>NODE_MODULE_CONTEXTS</code> : Set to 1 to load modules in their own global contexts.</li><li>– <code>NODE_DISABLE_COLORS</code> : Set to 1 to disable colors in the REPL.</li></ul>
Configuration file	<p>From this drop-down list, choose the file with the configuration settings to apply to the tracing session.</p> <p>A <b>configuration file</b> is a JavaScript file with the extension <code>.js</code> or <code>.conf.js</code> that contains valid JavaScript code that meets the <a href="#">Spy-js configuration requirements</a> . If IntelliJ IDEA detects files with the extension <code>.conf.js</code> in the project, these files are displayed in the drop-down list.</p> <p>Type the path to the configuration file manually or click the Browse button  and choose the location in the dialog box that opens. Once specified, a configuration file is added to the drop-down list so you can get it next time from the list instead of specifying the path.</p>

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

Alt+Up or  
Alt+Down

Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder

Use this button to [create a new folder](#) . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the buttons.

Sort configurations

Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool. Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments

to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the default server access configuration .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

The TestNG run/debug configuration is used to launch the tests that comply with the TestNG framework. The dialog consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

## Configuration tab

The composition of this tab depends on the selected testing scope - package, project, etc.

### ItemDescription

All in package	Run all tests in a package. Package. The fully qualified name of the package.  In whole project. IntelliJ IDEA will look for the tests in all the modules.  In single module. IntelliJ IDEA will look for the tests only in the module that is selected in the <a href="#">Use classpath of module field</a> .  Across module dependencies. The same as the previous option plus the modules that depend on that module.
Suite	Run a test suite. Suite. Specify the corresponding <code>testng.xml</code> file.
Group	Run a test group. Group. The group to be run. <a href="#">Learn more about TestNG groups</a> .
Class	Run a test class. Class. The fully qualified name of the test class to be run.
Method	Run a test method. Class. The fully qualified name of the test class.  Method. The name of the method to be run.
Pattern	Run the tests that conform to the specified pattern. Pattern. Form the pattern by clicking <a href="#">+</a> and then selecting one or more TestNG test classes. Alternatively, click <a href="#">-</a> and type the pattern in the dialog that opens.
Output directory	The directory in which test reports will be generated.
JDK Settings	
VM options	Options and arguments to be passed to the JVM in which the tests run. When specifying the options, follow these rules: <ul style="list-style-type: none"><li>– Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>– If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code> .</li><li>– If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li></ul> The <code>-classpath</code> option specified in this field overrides the classpath of the module.
Test runner parameters	Arguments to be passed to the test runner. Use the same rules as for specifying the <a href="#">VM options</a> .
Working directory	The current working directory for the tests.
Environment variables	The environment variables to be passed to the corresponding JVM.
Use classpath of module	The module whose classpath is used when running the tests.
JRE	The JRE to be used.
Shorten command line	Select a method that will be used to shorten the command line if the classpath gets too long or you have many VM arguments that exceed your OS command line length limitation: <ul style="list-style-type: none"><li>– none : IntelliJ IDEA will not shorten a long classpath. If the command line exceeds the OS limitation, IntelliJ IDEA will be unable to run your application and will display a message suggesting you to specify the shortening method.</li><li>– JAR manifest : IntelliJ IDEA will pass a long classpath via a temporary <code>classpath.jar</code> . The original classpath is defined in the <code>manifest</code> file as a <code>class-path</code> attribute in <code>classpath.jar</code> . Note that you will be able to preview the full command line if it was shortened using this method, not just the classpath of the temporary <code>classpath.jar</code> .</li><li>– classpath.file : IntelliJ IDEA will write a long classpath into a text file.</li><li>– User-local default : this legacy option is set automatically for projects created before IntelliJ IDEA version 2017.3. IntelliJ IDEA will configure this setting depending on the properties set in the <code>ide/workspace.xml</code> and</li></ul>

## Parameters

Properties file Specify the `.properties` file to be passed to TestNG.

Name - Value Additional parameters as key - value pairs.

## Listeners

  Use these icons to make up a list of listeners.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

Sampling Select this option to measure code coverage with minimal slow-down.

Tracing Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

Track per test coverage Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders. If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: – Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see
---	---	---

[Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<input type="checkbox"/> Show this page		Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<input type="checkbox"/> Active tool window		Select this option if you want the <a href="#">Run /Debug</a> tool windows to be

activated automatically when you run/debug your application. This option is enabled by default.

**Note** This setting is shared if you select to share your run/debug configuration, so the same method will be applied for your team members irrespective of their operating system.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Use this dialog box to define run/debug configuration for a Test::Unit , Shoulda , or Minitest test.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration.
Mode	Click one of the radio buttons to define the scope of tests to be performed: <ul style="list-style-type: none"><li>- All tests in folder : Click this radio button, if you want to run all tests in a directory.</li><li>- Test script : Click this radio button, if you want to run the specified test script.</li><li>- Test method : Click this radio button, if you want to run an individual method of a test class.</li></ul>
Test folder	Type in the text field the fully qualified path to the directory that contains the desired tests, or click <input type="button" value="..."/> and select the test directory in the <a href="#">dialog that opens</a> . This field is only available, when the All tests in folder scope is selected.
Test file name mask	Specify the mask of the test file name, for example: <pre>**/{*_test,test_*}.rb</pre> <p>This field is only available, when the All tests in folder scope is selected.</p>
Ruby script	Type the fully qualified path to the desired script in the text field, or click <input type="button" value="..."/> and select it in the <a href="#">dialog that opens</a> . <p>This field is only available, when the Test script scope is selected.</p>
Test name filter	In this field, type a filtering expression, or the name of a test method, depending on the framework in question. The test name filter can be a regular expression. <p>This field is only available, when the Test method option is selected.</p>
Use pre-loaded server	From the drop-down list, select the server to be used for executing scripts or examples. Select None if you want to execute a test script or example locally, without any server. <p><b>Tip</b> If both Zeus and Spork DRb servers are running simultaneously, it is Zeus that gets priority. If a pre-loaded server is already running, it will be selected from the drop-down list.</p> <p>Refer to <a href="#">Executing Tests on DRb Server</a> or <a href="#">Executing Tests on Zeus Server</a> for details.</p>
Runner options	Specify the options to be passed to the test runner.
Working directory	Specify the current directory to be used by the running task. By default, the project directory is used as a working directory.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

## ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window. <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.  Refer to the section <a href="#">Viewing Code Coverage Results</a> .
Merge data with previous results	When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View, taking into account the statistics of each time you have run the configuration. <b>Tip</b> Finally, the line is considered covered if it is covered at least once.
Packages and classes to record code coverage data	Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.
	Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .  Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.
	Click this button to delete the selected pattern from the list.
	Click this button to change the selected code coverage pattern.
Do not use the optimized C runtime	Select this check box to enable the option <code>--no-rcovrt</code> . Use this option with discretion, since it significantly slows down performance.
Enable coverage in test folders.	If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py if this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one	This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server: <ul style="list-style-type: none"><li>– If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.</li><li>– If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.</li><li>– If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the <code>ng</code> argument.</li></ul> If this check box is not selected, then the script is launched in a usual way, without Nailgun.
--	---

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"><li>– Full paths to specific files.</li><li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li><li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file</li></ul>

instead of the log entry alias.

Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate .xml file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.  <b>ItemKeyboardDescription shortcut</b>

		Click this icon to add a task to the list. Select the task to be added: – Run External tool. Select this option to run an application which is
---	---	---

external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.

If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.

- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.

See also, [Working with Artifacts](#) .

- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.

This option is available only if you have already at least one run/debug configuration in the current project.

- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .

- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:

- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
- If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#) .

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.

Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

---

  Click this icon to remove the selected task from the list.

  Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.

Alt+Up

Click this icon to move the selected task one line up in the list.

Alt+Down

Click this icon to move the selected task one line down in the list.

Show this page

Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.

Active tool window

Select this option if you want the [Run /Debug](#) tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | Tomcat Server | Local or Remote

Tomcat Server [run/debug configurations](#) let you deploy and debug your applications on [Apache Tomcat](#). (The Tomcat and TomEE Integration [plugin](#) must be enabled.)

See also, [Working with Server Run/Debug Configurations](#).

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click <a href="#">Configure</a> to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" OR "some arg"</code>.</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code>.</li></ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> ) in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li></ul>

- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
HTTP port	The server HTTP port.
HTTPs port	The server HTTPS port.
JMX port	The server JMX port.
AJP port	The server AJP port.
Deploy applications configured in Tomcat instance	The Tomcat configuration files, among other things, may list the applications that should be deployed at the server start. If this checkbox is selected, all the applications so listed will be deployed on the server in addition to the artifacts specified on the <a href="#">Deployment tab</a> . If the checkbox is not selected, only the artifacts and the external resources specified on the Deployment tab will be deployed.
Preserve sessions across restarts	Select this checkbox to preserve active HTTP sessions when restarting the server.

## Server tab for a remote configuration

### ItemDescription

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> in the Run or Debug tool window). The options are: – Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode. – Redeploy. The application artifact is rebuilt and redeployed.
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
JMX Port	The server JMX port. If you are not deploying anything with this run configuration, you don't need to specify this port.
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: – Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host. – ftp. The <a href="#">File Transfer Protocol</a> or <a href="#">Secure FTP</a> is used. – Local or mounted folder. The staging environment is a local folder or is accessed as a <a href="#">mounted folder</a> .

If the list is empty, you have to [enable the Remote Hosts Access plugin](#) which supports the corresponding functionality.

---

Host	<p>If Same file system is selected for Type , the only available option for Host is also Same file system . In all other cases, the list contains the existing configurations of the selected <a href="#">type</a> . So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.</p> <p>Select an existing configuration or create a new one.</p> <p>To create a new configuration:</p> <ol style="list-style-type: none"><li>1. Click  to the right of the list.</li><li>2. In the <a href="#">Deployment dialog</a> , click <a href="#">+</a>.</li><li>3. In the Add Server dialog, specify the configuration name, select the type, and click OK .</li><li>4. On the <a href="#">Connection tab</a> , specify the settings in the Upload/download project files section. The rest of the settings don't matter.</li><li>5. Click OK in the Deployment dialog.</li></ol>
Staging	<p>When deploying to the remote host, the application artifact or artifacts are placed into a staging folder which should be accessible to Tomcat. The settings in this section define the location of this staging folder. Note that if Same file system is selected for Type and Host , no settings in this section need to be specified.</p>
Path from root	<p>The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.</p>
Mapped as	<p>The absolute path to the staging folder in the local file system of the remote host.</p>
Remote connection settings	<p>The settings for accessing deployed applications.</p>
Host	<p>The fully qualified domain name or the IP address of the Tomcat host.</p>
Port	<p>The server HTTP port.</p>

---

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:` .
- The folder that you are going to use for staging is `C:\shared\staging` .

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Staging/Path from root: `staging`
- Staging/Mapped as: `C:\shared\staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use [+](#) . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

Note that deployment to a remote server is supported only for Tomcat 5 or later versions. Also note that to be able to deploy applications to a remote Tomcat server, you should enable the JMX support on the server. To do that, you should pass the following VM options to the server Java process:

```
-Dcom.sun.management.jmxremote=  
-Dcom.sun.management.jmxremote.port=1099  
-Dcom.sun.management.jmxremote.ssl=false  
-Dcom.sun.management.jmxremote.authenticate=false  
-Djava.rmi.server.hostname=<host>
```

where `<host>` is the server hostname (domain name) or IP address.

If `catalina.bat` or `catalina.sh` is used to start the server, these options may be passed to the server using the `CATALINA_OPTS` environment variable.

### ItemDescription

 or 	Use this icon or shortcut to add an artifact or an external resource to the list. <ul style="list-style-type: none"> <li>- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.</li> <li>- To add an external resource, select External Source and choose the location of the desired resource in the <a href="#">dialog that opens</a>.</li> </ul>
 or 	Use this icon or shortcut to remove the selected artifacts and external resources from the list.
 or 	Use this icon or shortcut to configure the selected artifact. (The <a href="#">Artifacts page</a> of the <a href="#">Project Structure dialog</a> will open.)
Application context	Specify the <a href="#">context root</a> for an artifact or external resource: select the artifact or the resource, and type or select the context root.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	If necessary, specify the classes and packages to be measured. <ul style="list-style-type: none"> <li>Use  or  to add classes or packages to the list.</li> <li>To remove the classes or packages from the list, select the corresponding list items and click .</li> </ul>
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 Run /	Use to switch between the settings for the run, debug and code coverage modes.
 Debug /	
 Coverage	

---

**Startup script** Specify the script to be used to start the server.  
Use default:

- If this checkbox is selected, the default script is used.  
 in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).
- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.  
When specifying the parameters and options, follow these rules:
    - Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
    - If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" or "some arg"` .
    - If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

---

**Shutdown script** Specify the script to be used to stop the server.  
Use default:

- If this checkbox is selected, the default script is used.  
 in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).
- Clear this checkbox to change the parameters passed to the script or to specify a different script:
  - To specify the script, click  and select the desired script in the [dialog that opens](#) .
  - To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.  
When specifying the parameters and options, follow these rules:
    - Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
    - If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" or "some arg"` .
    - If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

---

**Pass environment variables** To pass specific variables to the server environment, select this checkbox and specify the variables:

- To add a variable, click  and specify the variable name and value in the Name and Value fields respectively.
- To remove a variable from the list, select the variable and click  .

---

**Port** Use this field to change the debugger port.

---

**Debugger Settings** Click this button to edit the debugger options on the [Debugger page](#) of the [Settings dialog](#) .

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 **Run /** Use to switch between the settings for the run and debug modes. The settings are shown in the area under [To run/debug...](#)

 **Debug**

**To run/debug remote server JVM...** The command-line options for starting the server JVM. These are shown just for copying elsewhere.

**Transport (and all that follows)** The GUI for generating the remote debug command-line options shown in the area under [To run/debug...](#)

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

  Click this icon to add a task to the list. Select the task to be added, for example:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
- Make. Select this option to compile the project.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to build an [artifact](#) or artifacts. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.
- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript

source files are located. For more information, see [CoffeeScript](#) .

- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run.

For more information, see [Maven](#) .

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.  Then, to move a configuration into a folder, between the folders or out of a folder, use  and  . You can also drag a configuration into a folder.  To remove grouping, select a folder and click  .  See also, <a href="#">Creating Folders and Grouping Run/Debug Configurations</a> .

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | TomEE Server | Local or Remote

TomEE Server [run/debug configurations](#) let you deploy and debug your applications on [TomEE](#) . (The Tomcat and TomEE Integration [plugin](#) must be enabled.)

- [Name field and Share option](#)
- [Server tab for a local configuration](#)
- [Server tab for a remote configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab for a local configuration](#)
- [Startup/Connection tab for a remote configuration](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Working with Server Run/Debug Configurations](#) .

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code> .</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" OR "some arg"</code> .</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li></ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> ) in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li></ul>

- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
JRE	By default, the project JDK is used to run the application. If you want to specify an alternative JDK or JRE here, select it from the drop-down list.
HTTP port	The server HTTP port.
HTTPs port	The server HTTPS port.
JMX port	The server JMX port.
AJP port	The server AJP port.
Deploy applications configured in Tomcat instance	The TomEE configuration files, among other things, may list the applications that should be deployed at the server start. If this checkbox is selected, all the applications so listed will be deployed on the server in addition to the artifacts specified on the <a href="#">Deployment tab</a> . If the checkbox is not selected, only the artifacts and the external resources specified on the Deployment tab will be deployed.
Preserve sessions across restarts	Select this checkbox to preserve active HTTP sessions when restarting the server.

## Server tab for a remote configuration

### ItemDescription

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> in the Run or Debug tool window). The options are: <ul style="list-style-type: none"> <li>– Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li> <li>– Redeploy. The application artifact is rebuilt and redeployed.</li> </ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
JMX Port	The server JMX port.
Remote staging	This section contains the settings related to <a href="#">staging</a> . An <a href="#">example</a> of remote staging settings for a mounted folder is provided after this table.
Type	Select the way the staging environment or host is accessed for transferring the application artifact or artifacts from your local computer. (In the user interface of IntelliJ IDEA this setting is also referred to as the <a href="#">connection type</a> .) The available options are: <ul style="list-style-type: none"> <li>– Same file system. Select this option if the target server is installed on your local computer. The artifacts in this case are deployed locally and, thus, don't need to be transferred to a remote host.</li> <li>– ftp. The <a href="#">File Transfer Protocol</a> or <a href="#">Secure FTP</a> is used.</li> <li>– Local or mounted folder. The staging environment is a local folder or is accessed as a <a href="#">mounted folder</a> .</li> </ul> <p>If the list is empty, you have to <a href="#">enable the Remote Hosts Access plugin</a> which supports the corresponding functionality.</p>
Host	If Same file system is selected for Type , the only available option for Host is also Same file system . In all other cases, the list contains the existing configurations of the selected <a href="#">type</a> . So each configuration corresponds to an individual (S)FTP connection, or a local or mounted folder.  Select an existing configuration or create a new one.  To create a new configuration:  <a href="#">Click</a> to the right of the list

1. Click  to the right of the list.
2. In the [Deployment dialog](#) , click  .
3. In the Add Server dialog, specify the configuration name, select the type, and click OK .
4. On the [Connection tab](#) , specify the settings in the Upload/download project files section. The rest of the settings don't matter.
5. Click OK in the Deployment dialog.

Staging	When deploying to the remote host, the application artifact or artifacts are placed into a staging folder which should be accessible to TomEE. The settings in this section define the location of this staging folder. Note that if Same file system is selected for Type and Host , no settings in this section need to be specified.
Path from root	The path to the staging folder relative to the local or mounted folder, or the root of the (S)FTP host. You can use  to select the folder in the Choose target path dialog.
Mapped as	The absolute path to the staging folder in the local file system of the remote host.
Remote connection settings	The settings for accessing deployed applications.
Host	The fully qualified domain name or the IP address of the TomEE host.
Port	The server HTTP port.

## An example of remote staging settings for a mounted folder

Assuming that:

- `C:\shared` is a shared folder on the remote host which is mounted to the local computer as the drive `X:` .
- The folder that you are going to use for staging is `C:\shared\staging` .

Here are the corresponding remote staging settings:

- Type: Local or mounted folder.
- Host: The configuration should be selected in which the value in the Folder field is `X:\` (the Upload/download project files section on the Connection tab of the Deployment dialog).
- Staging/Path from root: `staging`
- Staging/Mapped as: `C:\shared\staging`

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use  . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

 or 	Use this icon or shortcut to add an artifact or an external resource to the list. <ul style="list-style-type: none"> <li>- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.</li> <li>- To add an external resource, select External Source and choose the location of the desired resource in the <a href="#">dialog that opens</a> .</li> </ul>
 or 	Use this icon or shortcut to remove the selected artifacts and external resources from the list.
 or 	Use this icon or shortcut to configure the selected artifact. (The <a href="#">Artifacts page</a> of the <a href="#">Project Structure dialog</a> will open.)
Application context	Specify the <a href="#">context root</a> for an artifact or external resource: select the artifact or the resource, and type or select the context root.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

	Select this check box to have the previous content of the selected log skipped.
	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

	Select the desired code coverage runner.
	Select this option to measure code coverage with minimal slow-down.
	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
	Select this checkbox to detect lines covered by one test and all tests covering line.
	<p>If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.</p> <p>To remove the classes or packages from the list, select the corresponding list items and click  .</p>
	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

	Use to switch between the settings for the run, debug and code coverage modes.
	
	
	<p>Specify the script to be used to start the server. Use default:</p> <ul style="list-style-type: none"> <li>- If this checkbox is selected, the default script is used.</li> <li>-  in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).</li> <li>- Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>- To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>- To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>- Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> Or <code>"some arg"</code> .</li> <li>- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li> </ul>
	<p>Specify the script to be used to stop the server. Use default:</p> <ul style="list-style-type: none"> <li>- If this checkbox is selected, the default script is used.</li> <li>-  in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).</li> <li>- Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>- To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>- To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>- Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> Or <code>"some arg"</code> .</li> </ul>

- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

Pass environment variables

To pass specific variables to the server environment, select this checkbox and specify the variables:

- To add a variable, click **+** and specify the variable name and value in the Name and Value fields respectively.
- To remove a variable from the list, select the variable and click **-** .

Port

Use this field to change the debugger port.

Debugger Settings

Click this button to edit the debugger options on the [Debugger page](#) of the [Settings dialog](#) .

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li> <li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li> <li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> </ul>
---	---	--

		Click this icon to remove the selected task from the list.
---	---	--

		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
---	---	---

		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
--	---	---

Show this page	Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
----------------	---

Activate tool window	If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.
----------------------	---

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.

Ctrl+D

Create a copy of the selected run/debug configuration.

View and edit the default settings for the selected run/debug configuration.

Alt+Up /

Move the selected run/debug configuration up and down in the list.

Alt+Down

The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

You can group run/debug configurations by placing them into folders.

To create a folder, select the configurations to be grouped and click . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#).

**Warning!** The following is only valid when Python Plugin is installed and enabled!

The Tox run/debug configuration enables you running test with different Python versions and interpreters.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Logs tab](#)

Click [here](#) for the description of the options that are common for all run/debug configurations.

## Configuration tab

### ItemDescription

Tox

**Arguments** Specify the arguments that are passed to the `tox.ini` script. So doing, the arguments are delimited with spaces, for example, `--some-arg --foo-arg`.

**Run only environment** Specify here the Python environments/interpreters, where your project will be executed. So doing, the environments are delimited with commas, for example, `py27,py34`.

Environment

**Project** Click this drop-down list to select one of the projects, [opened in the same IntelliJ IDEA window](#), where this run/debug configuration should be used. If there is only one open project, this field is not displayed.

**Environment variable** This field shows the list of environment variables. If the list contains several variables, they are delimited with semicolons.

To fill in the list, click the browse button, or press `Shift+Enter` and specify the desired set of environment variables in the Environment Variables dialog box.

To create a new variable, click `+`, and type the desired name and value.

Python Interpreter

**Interpreter options** In this field, specify the string to be passed to the interpreter. If necessary, click `+`, and type the string in the editor.

**Working directory** Specify a directory to be used by the running task.

- When a default run/debug configuration is created by the keyboard shortcut `Ctrl+Shift+F10`, or by choosing Run on the context menu of a script, the working directory is the one that contains the executable script. This directory may differ from the project directory.
- When this field is left blank, the `bin` directory of the IntelliJ IDEA installation will be used.

**Path mappings** This field appears, if a remote interpreter has been selected in the field Python interpreter.

Click the browse button `...` to define the required mappings between the local and remote paths. In the Edit Path Mappings dialog box, use `+`/`-` buttons to create new mappings, or delete the selected ones.

**Add content roots to PYTHONPATH** Select this check box to add all [content roots](#) of your project to the environment variable PYTHONPATH;

**Add source roots to PYTHONPATH** Select this check box to add all [source roots](#) of your project to the environment variable PYTHONPATH;

Docker container settings

**Warning!** This field only appears when [Docker-based remote interpreter](#) has been selected for a project.

**Note** Speaking about the correspondence of settings with some options (`--net`, `--link`, etc.), note that these options come from [Docker command line arguments](#).

Click `...` to open the dialog and specify the following settings:

- **Disable networking** : select this checkbox to have the networking disabled. This corresponds to `--net="none"`, which means that inside a container the external network resources are not available.
- **Network mode** : corresponds to the other values of the option `--net`.
  - `bridge` is the default value. An IP address will be allocated for container on the bridge's network and traffic will be routed through this bridge to the container.

Containers can communicate via their IP addresses by default. To communicate by name, they must be linked.

- `host` : use the host's network stack inside the container.
- `container:name|id` : use the network stack of another container, specified via its name or id.

Refer to the [Network settings](#) documentation for details.

- **Links** : Use this section to link the container to be created with the other containers. This is applicable to `Network mode = bridge` and corresponds to the `--link` option.
- **Publish all ports** : This corresponds to the option `--publish-all`.
- **Port bindings** : Use this field to specify the
- **Extra hosts** : This corresponds to the `--add-host` option. Refer to the page [Managing /etc/hosts](#) for details.
- **Volume bindings** : Use this field to specify the bindings between the special folders- volumes and the folders of the computer, where the Docker daemon runs. This corresponds to the `-v` option.

See [Managing data in containers](#) for details.

- Environment variables : Use this field to specify the list of environment variables and their values. This corresponds to the `-e` option. Refer to the page [ENV \(environment variables\)](#) for details.

Click  to expand the tables. Click ,  or  to make up the lists.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>– Full paths to specific files.</li> <li>– <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>– Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

---

Single instance only If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

---

Before launch Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

**Item**  
**KeyboardDescription**  
**shortcut**

Alt+Insert

Click this icon to add a task to the list. Select the task to be added:

- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#).
- Make. Select this option to have the project or module compiled. The [Make Module command](#) will be carried out if a particular module is specified in the run/debug configuration, and the [Make Project command](#) otherwise.  
If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.
- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.
- Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#).
- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#).
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#).
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application

files automatically uploaded to the server according to the default server access configuration .

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

IntelliJ IDEA lets you specify a Run/Debug configuration for [utest](#) .

This section provides descriptions of the [configuration-specific items](#) , as well as the [toolbar](#) and [options](#) that are common for all run/debug configurations.

The dialog box consists of the following tabs:

- [Configuration tab](#)
- [Code Coverage tab](#)
- [Logs tab](#)

## Configuration tab

### ItemDescription

**Test kind** From this drop-down list, select the scope for your tests and fill in the fields depending on your selection.

You can choose from the following options:

- **Test name** - select this option to run the specified Scala test. The name of the test appears in the Test Name field.
- **All in package** - select this option to run all Scala tests in the specified package.

Fill in the following fields:

- **Test Package** - specify the name of the package to be tested.
- **Search for tests** - use this drop-down list to select the scope of your search.
- **Class** - select this option to run all tests in a class.

Specify the fully qualified name of the class to be launched in the Test Class field. Type the class name or click  and select the desired class in the dialog that opens.

**VM parameters** If necessary, specify the string to be passed to the VM. When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" or "some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

If there is not enough space, you can click  and enter the string in the dialog that opens.

**Environment variables** Click  to open the Environment Variables dialog box where you can create variables and specify their values.

**Test options** Use this field to specify the additional test options. If there is not enough space, you can click  and enter the string in the dialog that opens.

**Working Directory** Specify the directory that will act as the current directory when running the test. It will act as the root directory for all relative input and output paths. By default, the directory where the project file resides, is used as a working directory. Type directory name, or click  and select the desired directory in the dialog that opens.

**Use classpath and SDK of module** From this drop-down list, select the module whose classpath will be used to run the application.

**Print information messages to console** Select this checkbox if you want to print information messages to the Scala console.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

**Choose code coverage runner** Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose [JaCoCo](#) or [Emma](#) for calculating coverage.

**Sampling** Select this option to measure code coverage with minimal slow-down.

**Tracing** Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.

**Track per test coverage** Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.

**Note** This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

**Merge data with** When you run your unit testing or application configuration several times, use this item to calculate statistics in

previous results the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data Click  and  buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the  button.

 Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis.

The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

 Click this button to delete the selected pattern from the list.

 Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders If this check box is selected, the folders marked as test  are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.

If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content Select this check box to have the previous content of the selected log skipped.

Save console output to file Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

Show console when a message is printed to standard output stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

 Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

 Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#) .

 Click this button to remove the selected log entry from the list.

 Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

  `Alt+Insert` Click this button to add a new configuration to the list.

  `Alt+Delete` Click this button to remove the selected configuration from the list.

  `Ctrl+D` Click this button to create a copy of the selected configuration.

 Edit defaults Click this button to edit the default configuration templates. The defaults are used for newly created configurations.

  `Alt+Up` or `Alt+Down` Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.

Move into new folder / Create new folder Use this button to [create a new folder](#) .  
If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.

Move run/debug configurations to a folder using drag-and-drop, or the  buttons.

Sort configurations Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

**Name** In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.

**Defaults** This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.

**Share** Select this check box to make the run/debug configuration available to other team members.  
If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate .xml file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

**Single instance only** If this check box is selected, this run/debug configuration cannot be launched more than once.  
Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.

This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.

If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.

**Before launch** Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

 Alt+Insert

- Click this icon to add a task to the list. Select the task to be added:
- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see [Configuring Third-Party Tools](#) and [External Tools](#) .
  - Build Artifacts. Select this option to have an [artifact](#) or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built.  
See also, [Working with Artifacts](#) .
  - Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
  - Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
  - Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
  - Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
  - Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
  - Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the

- Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
- If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).
  - Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).
  - Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
  - Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks. Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
<b>Show this page</b>	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
<b>Active tool window</b>	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | WebLogic Server | Local or Remote

WebLogic Server [run/debug configurations](#) let you deploy and debug your applications on [Oracle WebLogic Server](#). (The WebLogic Integration [plugin](#) must be enabled.)

- [Name field and Share option](#)
- [Server tab for a local configuration](#)
- [Server tab for a remote configuration](#)
- [Deployment tab](#)
- [Logs tab](#)
- [Code Coverage tab](#)
- [Startup/Connection tab for a local configuration](#)
- [Startup/Connection tab for a remote configuration](#)
- [Before Launch options](#)
- [Toolbar](#)

See also, [Working with Server Run/Debug Configurations](#).

## Name field and Share option

### ItemDescription

Name	Use this field to edit the name of the run/debug configuration. This field is not available when editing the run/debug configuration defaults.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration

### ItemDescription

Application server	Select the server configuration to be used. Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after starting the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
VM options	If necessary, specify the command-line options to be passed to the server JVM at the server start. If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.  When specifying the options, follow these rules: <ul style="list-style-type: none"><li>- Use spaces to separate individual options, for example, <code>-client -ea -Xmx1024m</code>.</li><li>- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg</code> or <code>"some arg"</code>.</li><li>- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop="\quoted_value\"</code>.</li></ul>
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> in the Run or Debug tool window). The update options are different for exploded and packed artifacts.  For exploded artifacts, the available options are: <ul style="list-style-type: none"><li>- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).</li><li>- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled. In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.</li><li>- Redeploy. The application artifact is rebuilt and redeployed.</li></ul>

- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
User	Specify the user name associated with the domain administrator's account.
Password	Specify the password of the domain administrator.
Domain Path and associated settings	Specify the path to the desired WebLogic domain directory. Also specify which of the server instances in your WebLogic domain should be started and provide the associated settings. Note that the server instance that is started is also the one to which your <a href="#">artifacts</a> are <a href="#">deployed</a> .  The available options depend on the domain structure: <ul style="list-style-type: none"> <li>– The domain contains only one WebLogic Server instance, the Administration Server: <ul style="list-style-type: none"> <li>– Admin Server. Select the name of the Administration Server from the list.</li> </ul> </li> <li>– The domain contains the Administration Server and one or more Managed Servers: <ul style="list-style-type: none"> <li>– Server to launch. Select the type of the server instance that should be started and specify the associated settings: <ul style="list-style-type: none"> <li>– Admin. The Administration Server. <ul style="list-style-type: none"> <li>– Admin Server. Select the name of the Administration Server from the list.</li> </ul> </li> <li>– Managed. One of the Managed Servers. <ul style="list-style-type: none"> <li>– Managed server. Select the name of the desired Managed Server from the list.</li> <li>– Admin server host. Specify the name or the IP address of the Administration Server host (e.g. <code>localhost</code> or <code>127.0.0.1</code> ).</li> <li>– Admin server port. Specify the Administration Server port.</li> </ul> </li> </ul> </li> </ul> </li> </ul> <p>By the time you execute the run/debug configuration which starts a Managed Server, the Administration Server in the corresponding domain must be already up and running.</p>

## Server tab for a remote configuration

### ItemDescription

Application server	Select the server configuration to be used. Note that this is a local server configuration. (When working with a remote server, the same server version must be available locally.) Click Configure to create a new server configuration or edit an existing one. (The <a href="#">Application Servers dialog</a> will open.)
After launch	Select this checkbox to start a web browser after connecting to the server and deploying the artifacts. Select the browser from the list. Click  ( <a href="#">Shift+Enter</a> ) to configure your web browsers.
With JavaScript debugger	If this checkbox is selected, the web browser is started with the JavaScript debugger enabled. Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.
The field underneath After launch	Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <a href="#">Ctrl+F10</a> in the Run or Debug tool window). The options are: <ul style="list-style-type: none"> <li>– Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li> <li>– Redeploy. The application artifact is rebuilt and redeployed.</li> </ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
User	Specify the user name associated with the domain administrator's account.
Password	Specify the password of the domain administrator.
Connect to and associated settings	Specify the server instance or cluster the project <a href="#">artifacts</a> should be <a href="#">deployed</a> to. Select the target category of the server instances and specify the associated settings: <ul style="list-style-type: none"> <li>– admin server. The Administration Server.</li> </ul>

- Server. Specify the name of the Administration Server.
- managed server. One of the Managed Servers.
  - Managed Server name. Specify the name of the target Managed Server.
  - Admin Server host. Specify the DNS name or the IP address of the Administration Server host.
  - Admin Server port. Specify the Administration Server port.
- cluster. One of the Managed Server clusters.
  - Cluster name. Specify the name of the target cluster.
  - Admin Server name. Specify the name of the Administration Server.

For the run/debug configuration to be functional, the following server instances in the target domain must be up and running:

- The Administration Server (in all cases).
- The target Managed Server if you are deploying the artifacts to a Managed Server.
- At least one of the Managed Servers in the target cluster if you are deploying the artifacts to a cluster.

---

Test Connection	Click this button to test the connection with the server to make sure that the current settings are correct.
-----------------	--

---

Host	The fully qualified domain name or the IP address of the host to which the applications are deployed: <ul style="list-style-type: none"> <li>- If you are deploying the applications to the Administration Server or a Managed Server cluster, this is the Administration Server host.</li> <li>- If you are deploying the applications to a Managed Server, this is the Managed Server host.</li> </ul>
------	--

---

Port	The server HTTP port.
------	-----------------------

---

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use . To edit the settings for an artifact or external resource, select the corresponding item in the list and use the controls in the right-hand part of the tab. For more information, see the table below.

### ItemDescription

---

or 	Use this icon or shortcut to add an artifact or an external resource to the list. <ul style="list-style-type: none"> <li>- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.</li> <li>- To add an external resource, select External Source and choose the location of the desired resource in the <a href="#">dialog that opens</a>.</li> </ul>
--------	--

---

or 	Use this icon or shortcut to remove the selected artifacts and external resources from the list.
--------	--

---

or	Use this icon or shortcut to configure the selected artifact. (The <a href="#">Artifacts page</a> of the <a href="#">Project Structure dialog</a> will open.)
----	---

---

Deployment method	For local run configurations: <ul style="list-style-type: none"> <li>- Weblogic.Deployer. The server admin interface is used.</li> <li>- Auto deploy. The artifact is copied to the server auto-deployment folder.</li> </ul>
-------------------	---

---

Check EJB CMP datasources	If this checkbox is selected, the names of persistent entities for EJB CMP data sources are validated. The validation is based on the mappings defined in WebLogic Server-specific EJB deployment descriptor files.
---------------------------	---

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#).

### ItemDescription

---

Is Active	Select check boxes in this column to have the log entries displayed in the corresponding tabs in the <a href="#">Run tool window</a> or <a href="#">Debug tool window</a> .
-----------	---

---

Log File Entry	The read-only fields in this column list the log files to show. The list can contain: <ul style="list-style-type: none"> <li>- Full paths to specific files.</li> <li>- <a href="#">Ant patterns</a> that define the range of files to be displayed.</li> <li>- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.</li> </ul> If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.
----------------	--

---

Skip Content	Select this check box to have the previous content of the selected log skipped.
--------------	---

---

Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
-----------------------------	---

---

Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
--	--

---

Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
---	--

---

	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	<p>If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.</p> <p>To remove the classes or packages from the list, select the corresponding list items and click .</p>
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 Run /	Use to switch between the settings for the run, debug and code coverage modes.
 Debug /	
 Coverage	
Startup script	<p>Specify the script to be used to start the server. Use default:</p> <ul style="list-style-type: none"> <li>- If this checkbox is selected, the default script is used.</li> <li>-  in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).</li> <li>- Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>- To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a>.</li> <li>- To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>- Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code>.</li> <li>- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code>.</li> <li>- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code>.</li> </ul>

Port	Use this field to change the debugger port.

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM..	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

		Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>– Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>– Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>– Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>– Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>– Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>– Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li></ul>
		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list.)
Show this page		Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
Activate tool window		If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.

## Toolbar

### ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.
		You can group run/debug configurations by placing them into folders. To create a folder, select the configurations to be grouped and click  . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#) .

This feature is only supported in the Ultimate edition.

Run | Edit Configurations | + | WebSphere Server | Local or Remote

WebSphere Server [run/debug configurations](#) let you deploy and debug your applications on [WebSphere Application Server](#) (version 6.1 or later) and the [WebSphere Application Server Liberty profile](#) . (The WebSphere Integration [plugin](#) must be enabled.)

When it's necessary to distinguish between the features for the Liberty profile and WebSphere Application Server, the first of the two is referred to as WAS LP, while the second - simply as WAS.

See also, [Working with Server Run/Debug Configurations](#) .

## Name field and Share option

### ItemDescription

**Name** Use this field to edit the name of the run/debug configuration.  
This field is not available when editing the run/debug configuration defaults.

**Share** Select this check box to make the run/debug configuration available to other team members.  
If the [directory-based project format](#) is used, the settings for a run/debug configuration are stored in a separate `.xml` file in the `.idea\runConfigurations` folder if the run/debug configuration is shared, or in the `.idea\workspace.xml` file otherwise.

If the [file-based format](#) is used, the settings are stored in the `.ipr` file for shared configurations, or in the `.iws` file otherwise.

This check box is not available when editing the run/debug configuration defaults.

## Server tab for a local configuration: WAS LP

### ItemDescription

**Application server** Select the server configuration to be used.  
Click Configure to create a new server configuration or edit an existing one. (The [Application Servers dialog](#) will open.)

**After launch** Select this checkbox to start a web browser after starting the server and deploying the artifacts.  
Select the browser from the list. Click  ( `Shift+Enter` ) to configure your web browsers.

**With JavaScript debugger** If this checkbox is selected, the web browser is started with the JavaScript debugger enabled.  
Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

**The field underneath After launch** Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.

**VM options** If necessary, specify the command-line options to be passed to the server JVM at the server start.  
If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m` .
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"` .
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop=\"quoted_value\"` .

**On 'Update' action** Select the necessary option for the [Update application](#) function ( or `Ctrl+F10` in the Run or Debug tool window).

The update options are different for exploded and packed artifacts.

For exploded artifacts, the available options are:

- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).
- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled.  
In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

**Show dialog** Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

**On frame deactivation** Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.)  
The options other than Do nothing have the same meanings as in the case of the [Update action](#).

**Server** Select the name of the target server.  
If the list is empty, create a server: in your Liberty profile installation folder, from the `wlp/bin` directory, run the following command:

```
server create <server-name>
```

If the message *Error: JMX administration should be enabled* is shown in the lower part of the dialog, click Fix.

As a result, the following is added into the configuration file `wlp/usr/servers/<server-name>/server.xml`:

```
<feature>localConnector-1.0</feature> (within <featureManager> )
<applicationMonitor updateTrigger="mbean"/>
```

## Server tab for a local configuration: WAS

### ItemDescription

**Application server** Select the server configuration to be used.  
Click Configure to create a new server configuration or edit an existing one. (The [Application Servers dialog](#) will open.)

**After launch** Select this checkbox to start a web browser after starting the server and deploying the artifacts.  
Select the browser from the list. Click  (Shift+Enter) to configure your web browsers.

**With JavaScript debugger** If this checkbox is selected, the web browser is started with the JavaScript debugger enabled.  
Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

**The field underneath After launch** Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of your Web application or its starting page.

**VM options** If necessary, specify the command-line options to be passed to the server JVM at the server start.  
If you need more room to type, click  next to the field to open the VM Options dialog where the text entry area is larger.

When specifying the options, follow these rules:

- Use spaces to separate individual options, for example, `-client -ea -Xmx1024m`.
- If an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg` or `"some arg"`.
- If an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value\"`.

**On 'Update' action** Select the necessary option for the [Update application](#) function ( or `Ctrl+F10` in the Run or Debug tool window).  
The update options are different for exploded and packed artifacts.

For exploded artifacts, the available options are:

- Update resources. All changed resources are updated (HTML, JSP, JavaScript, CSS and image files).
- Update classes and resources. Changed resources are updated; changed Java classes (EJBs, servlets, etc.) are recompiled.  
In the debug mode, the updated classes are hot-swapped. In the run mode, IntelliJ IDEA just updates the changed classes in the output folder. Whether such classes are actually reloaded in the running application, depends on the capabilities of the runtime being used.
- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

For packed artifacts, the available options are:

- Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug

mode.

- Redeploy. The application artifact is rebuilt and redeployed.
- Restart server. The server is restarted. The application artifact is rebuilt and redeployed.

---

Show dialog Select this checkbox if you want to see the Update dialog every time you use the [Update application](#) function. The Update dialog is used to select the [update option](#) prior to actually updating the application.

With JavaScript debugger If this checkbox is selected, the web browser is started with the JavaScript debugger enabled.  
Note that JavaScript debugging is available only for Firefox and Google Chrome. When you debug your JavaScript in Firefox for the first time, the JetBrains Firefox extension is installed.

---

The field Specify the URL the browser should go to when started. In most typical cases, this URL corresponds to the root of

underneath After launch	your Web application or its starting page.
On 'Update' action	Select the necessary option for the <a href="#">Update application</a> function (  or <b>Ctrl+F10</b> ) in the Run or Debug tool window). The options are: <ul style="list-style-type: none"> <li>– Hot swap classes. Changed classes are recompiled and reloaded at runtime. This option works only in the debug mode.</li> <li>– Redeploy. The application artifact is rebuilt and redeployed.</li> </ul>
Show dialog	Select this checkbox if you want to see the Update dialog every time you use the <a href="#">Update application</a> function. The Update dialog is used to select the <a href="#">update option</a> prior to actually updating the application.
On frame deactivation	Specify what IntelliJ IDEA should do when you switch from the IDE to a different application (for example, a web browser). (Frame deactivation means switching to a different application.) The options other than Do nothing have the same meanings as in the case of the <a href="#">Update action</a> .
Cell	Specify the target server cell.
Node	Specify the target server node.
Server	Specify the target server.
Username	Specify the name of the user on whose behalf IntelliJ IDEA will connect to the server.
Password	The password of the user specified in the <a href="#">Username field</a> .
SOAP Port	Specify the server SOAP port.
Test Connection	Click this button to test the connection with the server to make sure that the current settings are correct.
Use SSL connection	Select this checkbox to connect to the server using SSL. Specify the associated settings: <ul style="list-style-type: none"> <li>– Trust store. Specify the path to the truststore file. You can click  and select the necessary file in the <a href="#">dialog that opens</a> .</li> <li>– Trust store password. Specify the password for accessing the truststore.</li> <li>– Key store. Specify the path to the keystore file. You can click  and select the necessary file in the <a href="#">dialog that opens</a> .</li> <li>– Key store password. Specify the password for accessing the keystore.</li> </ul>
Remote connection settings	The settings for accessing deployed applications.
Host	The fully qualified domain name or the IP address of the server host.
Port	The server HTTP port.

## Deployment tab

Use this tab to specify which [artifacts](#) and/or external resources should be deployed onto the server. (An external resource means a deployable Web component such as a `.war` file which is not represented by a project artifact. Usually, such components are stored outside of the project scope.)

To add items to the deployment list (shown under Deploy at the server startup ), use . For more information, see the table below.

Note that deployment to WAS LP that runs on a different computer is not supported.

### ItemDescription

 or **Alt+Insert** Use this icon or shortcut to add an artifact or an external resource to the list.

- To add an artifact, select Artifact and choose the desired artifact in the dialog that opens.
- To add an external resource, select External Source and choose the location of the desired resource in the [dialog that opens](#) .

 or **Alt+Delete** Use this icon or shortcut to remove the selected artifacts and external resources from the list.

 or **F4** Use this icon or shortcut to configure the selected artifact. (The [Artifacts page](#) of the [Project Structure dialog](#) will open.)

Use custom context root If you want to assign a particular [context root](#) to an artifact or external resource, select the artifact or the resource, select the checkbox and specify the desired context root in the field underneath the checkbox.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.

- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown.  
If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content	Select this check box to have the previous content of the selected log skipped.
Save console output to file	Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the <a href="#">dialog that opens</a> .
Show console when a message is printed to standard output stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.
Show console when a message is printed to standard error stream	Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.
	Click this button to open the <a href="#">Edit Log Files Aliases dialog</a> where you can select a new log entry and specify an alias for it.
	Click this button to edit the properties of the selected log file entry in the <a href="#">Edit Log Files Aliases dialog</a> .
	Click this button to remove the selected log entry from the list.
	Click this button to edit the select log file entry. The button is available only when an entry is selected.

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

Note that this tab is not available for remote servers.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this checkbox to detect lines covered by one test and all tests covering line.
Packages and classes to record code coverage data	<p>If necessary, specify the classes and packages to be measured. Use  or  to add classes or packages to the list.</p> <p>To remove the classes or packages from the list, select the corresponding list items and click  .</p>
Enable coverage in test folders.	Select this checkbox to include the test source folders in code coverage analysis.

## Startup/Connection tab for a local configuration

### ItemDescription

 Run /	Use to switch between the settings for the run, debug and code coverage modes.
 Debug /	
 Coverage	
Startup script	<p>Specify the script to be used to start the server. Use default:</p> <ul style="list-style-type: none"> <li>– If this checkbox is selected, the default script is used.  in this case opens the Default Startup Script dialog which shows the contents of the Startup script field (readonly).</li> <li>– Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>– To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>– To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul> <p>When specifying the parameters and options, follow these rules:</p> <ul style="list-style-type: none"> <li>– Use spaces to separate individual parameters and options, for example, <code>-client -ea -Xmx1024m</code> .</li> <li>– If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, <code>some "arg" or "some arg"</code> .</li> <li>– If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, <code>-Dmy.prop=\"quoted_value\"</code> .</li> </ul>
Shutdown script	<p>Specify the script to be used to stop the server. Use default:</p> <ul style="list-style-type: none"> <li>– If this checkbox is selected, the default script is used.  in this case opens the Default Shutdown Script dialog which shows the contents of the Shutdown script field (readonly).</li> <li>– Clear this checkbox to change the parameters passed to the script or to specify a different script: <ul style="list-style-type: none"> <li>– To specify the script, click  and select the desired script in the <a href="#">dialog that opens</a> .</li> <li>– To specify the parameters, click  and specify the script parameters and VM options in the Configure VM and Program Parameters dialog.</li> </ul> </li> </ul>

When specifying the parameters and options, follow these rules:

- Use spaces to separate individual parameters and options, for example, `-client -ea -Xmx1024m` .
- If a parameter or an option includes spaces, enclose the spaces or the argument that contains the spaces in double quotes, for example, `some "arg" OR "some arg"` .
- If a parameter or an option includes double quotes (e.g. as part of the argument), escape the double quotes by means of the backslashes, for example, `-Dmy.prop="\quoted_value"` .

---

**Pass environment variables** To pass specific variables to the server environment, select this checkbox and specify the variables:

- To add a variable, click **+** and specify the variable name and value in the Name and Value fields respectively.
- To remove a variable from the list, select the variable and click **-** .

---

**Port** Use this field to change the debugger port.

---

**Debugger Settings** Click this button to edit the debugger options on the [Debugger page](#) of the [Settings dialog](#) .

## Startup/Connection tab for a remote configuration

This tab shows command-line options for starting the server JVM in the run and debug modes.

### ItemDescription

 Run /	Use to switch between the settings for the run and debug modes. The settings are shown in the area under <a href="#">To run/debug...</a>
 Debug	
To run/debug remote server JVM...	The command-line options for starting the server JVM. These are shown just for copying elsewhere.
Transport (and all that follows)	The GUI for generating the remote debug command-line options shown in the area under <a href="#">To run/debug...</a>

## Before Launch options

Specify which tasks should be carried out before starting the run/debug configuration.

### ItemShortcutDescription

	 Click this icon to add a task to the list. Select the task to be added, for example: <ul style="list-style-type: none"><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li><li>- Make. Select this option to compile the project. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li><li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>- Build Artifacts. Select this option to build an <a href="#">artifact</a> or artifacts. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li><li>- Run Another Configuration. Select this option to execute another run/debug configuration. In the dialog that opens, select the configuration to be run.</li><li>- Run Ant target. Select this option to run an Ant target. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li><li>- Generate CoffeeScript Source Maps. Select this option to generate the source maps for your CoffeeScript sources. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see <a href="#">CoffeeScript</a> .</li><li>- Run Maven Goal. Select this option to run a Maven goal. In the dialog that opens, select the goal to be run. For more information, see <a href="#">Maven</a> .</li><li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li></ul>

---

	 Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
---	---

---

	 Click these icons to move the selected task one line up or down in the list. (The tasks are performed in the order that they appear in the list)
--	--

---

Show this page	Select this checkbox to show the run/debug configuration settings prior to actually starting the run/debug configuration.
----------------	---

---

Activate tool window	If this checkbox is selected, the <a href="#">Run</a> or the <a href="#">Debug tool window</a> opens when you start the run/debug configuration. Otherwise, the tool window isn't shown. However, when the configuration is running, you can open the corresponding tool window for it yourself if necessary.
----------------------	---

## Toolbar

## ItemShortcutDescription

		Create a run/debug configuration.
		Delete the selected run/debug configuration.
		Create a copy of the selected run/debug configuration.
		View and edit the default settings for the selected run/debug configuration.
		Move the selected run/debug configuration up and down in the list. The order of configurations in the list defines the order in which the configurations appear in the corresponding list on the main toolbar.

 You can group run/debug configurations by placing them into folders.  
To create a folder, select the configurations to be grouped and click . Specify the name of the folder.

Then, to move a configuration into a folder, between the folders or out of a folder, use  and . You can also drag a configuration into a folder.

To remove grouping, select a folder and click .

See also, [Creating Folders and Grouping Run/Debug Configurations](#).

This feature is only supported in the Ultimate edition.

This run/debug configuration becomes available, when [XPath View+XSLT Support](#) plugin is enabled.

## Getting access to the Run/Debug Configuration: XSLT dialog

Make sure the [XPath View+XSLT Support](#) plugin is enabled. The plugin is activated by default. If the plugin is disabled, enable it on the [Plugins settings](#) page as described in [Enabling and Disabling Plugins](#).

## Settings tab

### ItemDescription

- |        |  |
|--------|--|
| Input  | <p>Use the controls in this area to specify the XML file to process and the script to be executed.</p> <ul style="list-style-type: none"><li>- XSLT Script File - in this text box, specify the path to the XSLT stylesheet file. Type the path manually or click the Browse button  and select the desired file in the Choose XSLT File dialog box, that opens.</li><li>- Choose XML Input File - from this drop-down list, select the XML input file to be transformed. The list contains all the XML files that have been associated with the chosen stylesheet via the File Associations functionality. To specify a file, which is not on the list, click the Browse button  and select the desired file in the Choose XML File dialog box, that opens.</li></ul>   |
| Output | <p>Use the controls in this area to configure handling of the script output.</p> <ul style="list-style-type: none"><li>- Show in Default Console - select this option to have the output displayed in the normal run console, together with any warnings and error messages from the XSLT transformer, as well as messages generated by the script, e.g. by <code>xsl:message</code>.</li><li>- Show in Extra Console Tab - select this option to have the produced output displayed in an extra, XSLT Output, tab. This option is selected by default.</li><li>- Highlight Output As - from this drop-down list, select the <a href="#">file type</a> to highlight the output as.</li><li>- Save to File - select this option to have the output saved directly to a file. In the text box, specify the name of the target file. Type the path to the file manually or click the Browse button  and select the desired file in the Choose Output File dialog box, that opens. If you type the name of a file that does not exist, IntelliJ IDEA will create a file and save the output to it.</li><li>- Open File in Editor After Execution - select this checkbox to have the file with the output opened in the editor after the script is executed successfully.</li><li>- Open File in Web Browser After Execution - select this checkbox to have the file with the output opened in the configured Web browser after the script is executed successfully.</li></ul> |

**Warning!** The specified file will be overwritten without requesting for confirmation.

- |            |  |
|------------|--|
| Parameters | <p>Use the controls in this area to create and manage a list of parameters to be passed to the script.</p> <ul style="list-style-type: none"><li>- Add (+) - click this button to create a new entry.</li><li>- Remove (-) - click this button to remove the selected entry from the list.</li><li>- Name - in this text box, specify the name of the parameter.</li><li>- Value - in this text box, specify the value of the parameter.</li></ul> |
|------------|--|

**Warning!** The field is mandatory. Parameters without values are not passed to the script. Values are not assigned by default.

## Advanced tab

In this tab, configure additional options that are not commonly required in run configurations.

### ItemDescription

- |                      |  |
|----------------------|--|
| Smart Error Handling | <ul style="list-style-type: none"><li>- Clear this checkbox to have the console display full error messages including their complete stack traces, when an error occurs during execution.</li><li>- Select this checkbox to suppress showing stacktraces and have the console display only the relevant information about errors.</li></ul>  |
| VM Arguments         | <p>In this text box, specify optional VM arguments to be passed to the VM where the XSLT script is executed. These can be heap size, garbage collection options, file encoding, etc. If the line of VM arguments is too long, click the  button and type the text in the VM Arguments dialog box, that opens.</p>           |
| Working Directory    | <p>In this text box, specify the working directory to use. Type the path manually or click the Browse button  and select the desired folder in the Working Directory dialog box, that opens.</p> <p>If no folder is specified in text box, the working directory will be the one where the XSLT script file is located.</p> |
| Classpath and JDK    | <p>In this area, specify the environment to run the script in. By default, it is the module the XSLT file belongs to.</p> <ul style="list-style-type: none"><li>- From Module - select this option to execute the script in a specific module. From this drop-down list, select the desired module.</li></ul>  |

**Tip** The full classpath to the selected module is included. This can be required if the script uses custom XSLT Extension Functions.

- Use JDK - select this option to choose the JDK without including anything module- or project-related into the classpath.

**Tip** It can be useful to explicitly choose a specific JDK to test the script with.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
	 or 	Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	<p>Select this check box to make the run/debug configuration available to other team members.</p> <p>If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.</p> <p>If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.</p> <p>This check box is not available when editing the run/debug configuration defaults.</p>
Single instance only	<p>If this check box is selected, this run/debug configuration cannot be launched more than once.</p> <p>Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.</p> <p>This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.</p> <p>If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.</p>
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		<p>Click this icon to add a task to the list. Select the task to be added:</p> <ul style="list-style-type: none"> <li>- Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a> .</li> <li>- Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. If an error occurs during the compilation, IntelliJ IDEA won't attempt to start the run/debug configuration.</li> <li>- Make, no error check. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li> <li>- Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be built. See also, <a href="#">Working with Artifacts</a> .</li> <li>- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run. This option is available only if you have already at least one run/debug configuration in the current project.</li> <li>- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see <a href="#">Ant</a> .</li> <li>- Run Grunt task. Select this option to run a Grunt task. In the Grunt</li> </ul>
---	---	--

task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.

- Run Gulp task. Select this option to run a Gulp task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.

Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.

- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.

Specify the location of the Node.js interpreter and the parameters to pass to it.

- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.

- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#).

- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run. For more information, see [Maven](#).

- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.

- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#).

For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#).

- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button , and select the desired task from the list of available tasks.

Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

		Click this icon to remove the selected task from the list.
		Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
		Click this icon to move the selected task one line up in the list.
		Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

This feature is only supported in the Ultimate edition.

**Warning!** The following is only valid when RubyPlugin is installed and enabled!

Zeus run/debug configuration is created as a temporary one on launching the Zeus server. You can change settings as required, assign a name, save this configuration as permanent, and further use it to run Zeus server.

In this section:

- [Prerequisites](#)
- [Configuration tab](#)
- [Bundler tab](#)
- [Code Coverage tab](#)
- [Nailgun tab](#)
- [Logs tab](#)
- [Toolbar](#)
- [Common options](#)

## Prerequisites

Before you start working with Ruby, make sure that Ruby plugin is [installed and enabled](#) . The plugin is not bundled with IntelliJ IDEA.

Also make sure that the following prerequisites are met:

- Ruby SDK is downloaded and installed on your machine.
- The required framework SDKs are downloaded and installed on your machine.

Refer to their respective download and installation pages for details:

- [Ruby](#)
- [Ruby on Rails](#)

## Configuration tab

### ItemDescription

Command	In this text field, type one of the supported <a href="#">Zeus commands</a> . When the server is launched, the default command is <code>start</code> .  Note that <a href="#">code completion</a> is available in this field.
Arguments	In this text field, type the arguments to be passed to the Zeus command specified above.  Note that <a href="#">code completion</a> is available in this field.
Environment variables	Specify the list of environment variables as the name-value pairs, separated with semi-colons. Alternatively, click the ellipsis button to create variables and specify their values in the Environment Variables dialog box.
Ruby arguments	Specify the arguments to be passed to the Ruby interpreter. Classpath property is added to Nailgun settings.
Ruby SDK	Specify the desired Ruby interpreter. You can opt to choose the project default Ruby SDK, or select a different one from the drop-down list of configured Ruby SDKs.

## Bundler tab

### ItemDescription

Run the script in the context of the bundle	If this check box is selected, the script in question will be executed as specified in the <code>gemfile</code> .
---	---

## Code Coverage tab

Use this tab to configure [code coverage](#) monitoring options.

### ItemDescription

Choose code coverage runner	Select the desired code coverage runner. By default, IntelliJ IDEA uses its own coverage engine with the Sampling mode. You can also choose <a href="#">JaCoCo</a> or <a href="#">Emma</a> for calculating coverage.
Sampling	Select this option to measure code coverage with minimal slow-down.
Tracing	Select this option to collect accurate branch coverage. This mode is available for the IntelliJ IDEA code coverage runner only.
Track per test coverage	Select this check box to detect lines covered by one test and all tests covering line. If this check box is selected,  becomes available on the toolbar of the coverage statistic pop-up window.  <b>Note</b> This option is only available for the Tracing mode of code coverage measurement for the testing run/debug configurations.

Refer to the section [Viewing Code Coverage Results](#) .

Merge data with previous results When you run your unit testing or application configuration several times, use this item to calculate statistics in the Project View , taking into account the statistics of each time you have run the configuration.

**Tip** Finally, the line is considered covered if it is covered at least once.

Packages and classes to record code coverage data Click and buttons to specify classes and packages to be measured. You can also remove classes and packages from the list by selecting them in the list and clicking the button.

Click this button to define the scope of code coverage analysis. In the Add Pattern dialog box that opens, type the comma-delimited list of Ruby regular expressions, and specify whether the matching files should be included into or excluded from code coverage analysis. The patterns defining files to be included into code coverage analysis, are marked with + ; the ones to be excluded are marked with - .

Each pattern can be enabled or disabled. To do that, select or clear the check box next to a pattern. By default, all newly created patterns are enabled.

Click this button to delete the selected pattern from the list.

Click this button to change the selected code coverage pattern.

Do not use the optimized C runtime Select this check box to enable the option `--no-rcovrt` . Use this option with discretion, since it significantly slows down performance.

Enable coverage in test folders. If this check box is selected, the folders marked as test are included in the code coverage analysis.

Use bundled coverage.py If this check box is selected, IntelliJ IDEA will use the bundled `coverage.py` .

If this check box is not selected, IntelliJ IDEA will use the coverage tool included in the selected Python interpreter.

Refer to the section [Code Coverage](#) for details.

## Nailgun tab

### ItemDescription

Run new instance of the Nailgun server, or use already started one This check box is only available for JRuby used as the project interpreter. When a run/debug configuration, with this check box selected, is launched, IntelliJ IDEA analyzes the running processes, and does one of the following, depending on the presence of the running Nailgun server:

- If there is no running Nailgun server, or if there is a Nailgun server on a non-default port, or with a different gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with the required gemset, IntelliJ IDEA does nothing.
- If a Nailgun server runs on a different port with the required gemset, then IntelliJ IDEA suggests to specify the desired port number.
- If a Nailgun server runs on the default port with a different gemset, then IntelliJ IDEA deletes the `ng` argument.

If this check box is not selected, then the script is launched in a usual way, without Nailgun.

## Logs tab

Use this tab to specify which log files generated while running or debugging should be displayed in the console, that is, on the dedicated tabs of the [Run](#) or [Debug tool window](#) .

### ItemDescription

Is Active Select check boxes in this column to have the log entries displayed in the corresponding tabs in the [Run tool window](#) or [Debug tool window](#) .

Log File Entry The read-only fields in this column list the log files to show. The list can contain:

- Full paths to specific files.
- [Ant patterns](#) that define the range of files to be displayed.
- Aliases to substitute for full paths or patterns. These aliases are also displayed in the headers of the tabs where the corresponding log files are shown. If a log entry pattern defines more than one file, the tab header shows the name of the file instead of the log entry alias.

Skip Content Select this check box to have the previous content of the selected log skipped.

Save console output to file Select this check box to save the console output to the specified location. Type the path manually, or click the browse button and point to the desired location in the [dialog that opens](#) .

Show console when a message is printed to standard output stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.out.

Show console when a message is printed to standard error stream Select this check box to activate the output console and bring it forward if an associated process writes to Standard.err.

Click this button to open the [Edit Log Files Aliases dialog](#) where you can select a new log entry and specify an alias for it.

Click this button to edit the properties of the selected log file entry in the [Edit Log Files Aliases dialog](#).

Click this button to remove the selected log entry from the list.

 Click this button to edit the selected log file entry. The button is available only when an entry is selected.

## Toolbar

### ItemShortcutDescription

		Click this button to add a new configuration to the list.
		Click this button to remove the selected configuration from the list.
		Click this button to create a copy of the selected configuration.
	Edit defaults	Click this button to edit the default configuration templates. The defaults are used for newly created configurations.
		Use these buttons to move the selected configuration or folder up and down in the list. The order of configurations or folders in the list defines the order in which configurations appear in the Run/Debug drop-down list on the main toolbar.
	Move into new folder / Create new folder	Use this button to <a href="#">create a new folder</a> . If one or more run/debug configurations are in focus, the selected run/debug configurations are automatically moved to the newly created folder. If only a category is in focus, an empty folder is created.  Move run/debug configurations to a folder using drag-and-drop, or the  buttons.
	Sort configurations	Click this button to sort configurations in alphabetical order.

## Common options

### ItemDescription

Name	In this text box, specify the name of the current run/debug configuration. This field does not appear for the default run/debug configurations.
Defaults	This node in the left-hand pane of the dialog box contains the default run/debug configuration settings. Select the desired configuration to change its default settings in the right-hand pane. The defaults are applied to all newly created run/debug configurations.
Share	Select this check box to make the run/debug configuration available to other team members. If the <a href="#">directory-based project format</a> is used, the settings for a run/debug configuration are stored in a separate <code>.xml</code> file in the <code>.idea\runConfigurations</code> folder if the run/debug configuration is shared, or in the <code>.idea\workspace.xml</code> file otherwise.  If the <a href="#">file-based format</a> is used, the settings are stored in the <code>.ipr</code> file for shared configurations, or in the <code>.iws</code> file otherwise.  This check box is not available when editing the run/debug configuration defaults.
Single instance only	If this check box is selected, this run/debug configuration cannot be launched more than once. Every time a new run/debug configuration is launched, IntelliJ IDEA checks the presence of the other instances of the same run/debug configuration, and displays a confirmation dialog box. If you click OK in the confirmation dialog box, the first instance of the runner will be stopped, and the next one will take its place.  This makes sense when the usage of certain resources can cause conflicts, or when launching two run/debug configurations of the same type consumes too much of the CPU and memory resources.  If this check box is not selected, it is possible to launch as many instances of the runner as required. So doing, each runner will start in its own tab of the Run tool window.
Before launch	Specify which tasks must be performed before applying the run/debug configuration. The specified tasks are performed in the order they appear in the list.

### ItemKeyboardDescription shortcut

		Click this icon to add a task to the list. Select the task to be added: <ul style="list-style-type: none"><li>– Run External tool. Select this option to run an application which is external to IntelliJ IDEA. In the dialog that opens, select the application or applications that should be run. If the necessary application is not defined in IntelliJ IDEA yet, add its definition. For more information, see <a href="#">Configuring Third-Party Tools</a> and <a href="#">External Tools</a>.</li><li>– Make. Select this option to have the project or module compiled. The <a href="#">Make Module command</a> will be carried out if a particular module is specified in the run/debug configuration, and the <a href="#">Make Project command</a> otherwise. The same as the Make option but IntelliJ IDEA will try to start the run/debug configuration irrespective of the compilation result.</li><li>– Build Artifacts. Select this option to have an <a href="#">artifact</a> or artifacts built. In the dialog that opens, select the artifact or artifacts that should be</li></ul>
---	---	--

built.

See also, [Working with Artifacts](#) .

- Run Another Configuration. Select this option to have another run/debug configuration executed. In the dialog that opens, select the configuration to run.  
This option is available only if you have already at least one run/debug configuration in the current project.
- Run Ant target. Select this option to have an Ant target run. In the dialog that opens, select the target to be run. For more information, see [Ant](#) .
- Run Grunt task. Select this option to run a Grunt task. In the Grunt task dialog box that opens, specify the `Gruntfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Grunt tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `grunt-cli` package.
- Run Gulp task. Select this option to run a Grunt task. In the Gulp task dialog box that opens, specify the `Gulpfile.js` where the required task is defined, select the task to execute, and specify the arguments to pass to the Gulp tool.  
Specify the location of the Node.js interpreter, the parameters to pass to it, and the path to the `gulp` package.
- Run npm Script. Select this check box to execute an npm script. In the NPM Script dialog box that opens, specify the `package.json` file where the required script is defined, select the script to execute, choose the command to apply to it, and specify the arguments to execute the script with.  
Specify the location of the Node.js interpreter and the parameters to pass to it.
- Compile TypeScript. Select this option to run the built-in TypeScript compiler and thus make sure that all the changes you made to your TypeScript code are reflected in the generated JavaScript files. In the TypeScript Compile Settings dialog that opens, select or clear the Check errors checkbox to configure the behaviour of the compiler in case any errors are detected:
  - If the Check errors checkbox is selected, the compiler will show all the errors and the run configuration will not start.
  - If the Check errors checkbox is cleared, the compiler will show all the detected errors but the run configuration still will be launched.
- Generate CoffeeScript Source Maps. Select this option to have the source maps for your CoffeeScript sources generated. In the dialog that opens, specify where your CoffeeScript source files are located. For more information, see [CoffeeScript](#) .
- Run Maven Goal. Select this option to have a Maven goal run. In the dialog that opens, select the goal to be run.  
For more information, see [Maven](#) .
- Run Remote External tool : Add a remote SSH external tool. Refer to the section [Remote SSH External Tools](#) for details.
- Upload files to Remote Host. Select this option to have the application files automatically uploaded to the server according to the [default server access configuration](#) .  
For more information, see [Configuring Synchronization with a Web Server](#) and [Uploading and Downloading Files](#) .
- Run Rake task :Add a Rake task to be executed prior to running or debugging. To choose a Rake task, click the browse button  , and select the desired task from the list of available tasks.  
Note that [code completion](#) is available here.

To learn more about Rake support, refer to [Rake Support](#) section.

- Run JRuby compiler : choose this option to execute JRuby compiler with the specified target path, compiler process heap size, and command line parameters (if any).

	<input type="button" value="Alt+Delete"/>	Click this icon to remove the selected task from the list.
	<input type="button" value="Enter"/>	Click this icon to edit the selected task. Make the necessary changes in the dialog that opens.
	<input type="button" value="Alt+Up"/>	Click this icon to move the selected task one line up in the list.
	<input type="button" value="Alt+Down"/>	Click this icon to move the selected task one line down in the list.
Show this page	<input type="checkbox"/>	Select this check box to have the run/debug configuration settings shown prior to actually starting the run/debug configuration.
Active tool window	<input type="checkbox"/>	Select this option if you want the <a href="#">Run /Debug</a> tool windows to be activated automatically when you run/debug your application. This option is enabled by default.

Ctrl+Shift+Alt+L

The dialog appears when you press `Ctrl+Shift+Alt+L` in the editor of the current file. If you choose `Code | Reformat Code` on the main menu or press `Ctrl+Alt+L`, IntelliJ IDEA tries to reformat the source code of the specified scope automatically.

#### ItemDescription

Only VCS changed text	<p>If this checkbox is selected, then reformatting will apply only to the files that have been <a href="#">changed locally</a>, but not yet checked in to the repository.</p> <p>This checkbox is only available for the files under version control.</p>
Selected text	<p>Choose this option to have the currently selected fragment of source code reformatted.</p>
Whole file	<p>Choose this option to have all the source code in the current file reformatted.</p>
Optimize imports	<p>Select this checkbox to remove unused import statements from the code within the selected scope.</p>
Rearrange code	<p>Select this checkbox to reorder your source code entries according to the configurations specified in the Arrangement tab of your <a href="#">Code Style settings</a>.</p> <p>This checkbox is not available for Python files.</p>
Run	<p>Click this button to start reformatting the source code within the specified scope.</p>

Ctrl+Alt+L

---

This dialog box appears when you select a Reformat Code action on the directory.

#### ItemDescription

---

**Directory/Module** This is a read-only field that displays the name of the selected directory or module.

---

**Options** This area displays options for your code reformatting.

You can select from the following options:

- Include subdirectories: select this checkbox to have source code from files in the nested directories reformatted. This checkbox only appears when the nested directories exist.
- Optimize imports: select this checkbox to remove unused import statements from the code within the selected scope.
- Rearrange entries: select this checkbox to reorder your source code entries.
- Only VCS changed text: if this checkbox is selected, then reformatting will apply only to the files that have been [changed locally](#) , but not yet checked in to the repository.

This checkbox is only available for the files under version control.

---

**Filters** This area displays options for the filters that you can apply to the code reformatting action.

You can select from the following options:

- Scope: select this checkbox to choose, from the drop-down list, a scope to which you want to apply your reformatting options. If you want to configure a custom scope, click  button to open a [Scopes](#) dialog.
  - File mask(s): select this checkbox to choose, from the drop-down list, file extensions to which you want to apply your reformatting options.
- 

**Run** Click this button to start reformatting the source code within the specified scope.

This dialog appears when you define rules aliases in the Arrangement tab for Java in [Code Style](#) dialog.

#### ItemDescription

---

<alias name> Use this area to add a new alias definition, check the existing one or remove the ones you do not need.

You can use the following commands respectively:

-  - click this icon to add a new alias.
  -  - click this icon to remove an existing alias from the list.
  -  - click this icon to copy a specified rules' sequence to the created alias.
- 

Rules alias definitions Use this area to define the rules' sequence for the created alias. You can also add a new rule, edit and remove the existing ones, and move them up or down.

For more information on the rules, see [Code Style](#) reference page, arrangement section.

The dialog box opens when you attempt to open a file in the editor, but IntelliJ IDEA does not recognize its type by the file extension. Use the dialog box to associate unknown file extensions with existing file types.

#### ItemDescription

Open matching files in IntelliJ IDEA	When this option is selected, IntelliJ IDEA treats the type of the file to be opened as one of the recognized file types. Choose the relevant type from the list box below, that displays all the file types recognized by IntelliJ IDEA.
File Pattern	In this text box, specify the file pattern to be associated with the selected file type. By default, the text box shows the following pattern: <code>*.&lt;current file full extension&gt;</code> .
Open matching files in associated application	When this option is selected, IntelliJ IDEA attempts to open the selected file using its native application, if this application is available.

**TIP** You can [change the association](#) later in the [File Types](#) settings page.

F4

The Resource Bundle Editor is a special tool designed to work with sets of [properties files](#) . It shows all files in a bundle, and enables you to perform mass actions on the properties files.

#### ItemTooltip and shortcut

 Sort Alphabetically If this button is pressed, the properties in the left pane are sorted in alphabetical order. Otherwise, they are shown as they are introduced in the properties file.

 Group by Prefixes If this button is pressed, the properties are grouped according to the separators they have. The Group by drop-down menu enables you to choose the necessary separator:

If the button is not pressed, properties are shown as the items of the property node.

 Group By Specify the desired separator character, or choose one from the list.

 Expand all Use these buttons to have all nodes expanded or collapsed.

 Ctrl+NumPad Plus

Collapse all

Ctrl+NumPad -

 F1 Click this button to open the current reference page.

IntelliJ IDEA helps you create the [file templates](#) from the existing files.

## ItemDescription

Name	Specify here the name under which the new template will appear in the Files tab of the <a href="#">File and Code Templates</a> settings. By default, the name of the current file is used.
Extension	Specify here the extension of the file to be created by this new template. By default, the extension of the current file is used.

Template text	<p>Edit the template contents. You can use:</p> <ul style="list-style-type: none"><li>– Plain text.</li><li>– <code>#parse</code> directives to work with <a href="#">template includes</a>.</li><li>– Custom variables. Variables' names can be defined either directly in the template through the <code>#set</code> directive or during the file creation. Note that IntelliJ IDEA doesn't prompt for the values of Velocity variables defined with <code>#set</code>.</li><li>– Variables to be expanded into corresponding values in the <code>\${&lt;variable_name&gt;}</code> format. The available predefined file template variables are:<ul style="list-style-type: none"><li>– <code>\${PACKAGE_NAME}</code> - the name of the target package where the new class or interface will be created.</li><li>– <code>\${PROJECT_NAME}</code> - the name of the current project.</li><li>– <code>\${FILE_NAME}</code> - the name of the PHP file that will be created.</li><li>– <code>\${NAME}</code> - the name of the new file which you specify in the New File dialog box during the file creation.</li><li>– <code>\${USER}</code> - the login name of the current user.</li><li>– <code>\${DATE}</code> - the current system date.</li><li>– <code>\${YEAR}</code> - the current year.</li><li>– <code>\${MONTH}</code> - the current month.</li><li>– <code>\${DAY}</code> - the current day of the month.</li><li>– <code>\${TIME}</code> - the current system time.</li><li>– <code>\${HOUR}</code> - the current hour.</li><li>– <code>\${MINUTE}</code> - the current minute.</li><li>– <code>\${PRODUCT_NAME}</code> - the name of the IDE in which the file will be created.</li><li>– <code>\${MONTH_NAME_SHORT}</code> - the first 3 letters of the month name. Example: Jan, Feb, etc.</li><li>– <code>\${MONTH_NAME_FULL}</code> - full name of a month. Example: January, February, etc.</li></ul></li></ul>
---------------	--

IntelliJ IDEA provides a set of additional variables for [PHP include templates](#). Include templates are used to define reusable pieces of code (namely, file headers and [PHPDoc comments](#)) to be inserted in file templates via the [#parse directive](#).

The following variables are available in [PHP include templates](#):

- `${NAME}` - the name of the class, field, or function (method) for which the PHPDoc comment will be generated.
- `${NAMESPACE}` - the fully qualified name (without a leading slash) of the class or field namespace.
- `${CLASS_NAME}` - the name of the class where the field to generate the PHPDoc comment for is defined.
- `${STATIC}` - gets the value `static` if the function (method) or field to generate the comment for is `static`. Otherwise evaluates to an empty string.
- `${TYPE_HINT}` - a prompt for the `return` value of the function (method) to generate the comment for. If the return type cannot be detected through the static analysis of the function (method), evaluates to `void`.
- `${PARAM_DOC}` - a documentation comment for parameters. Evaluates to a set of lines `@param type name`. If the function to generate comments for does not contain any parameters, the variable evaluates to empty content.
- `${THROWS_DOC}` - a documentation comment for exceptions. Evaluates to a set of lines `@throws type`. If the function to generate comments for does not throw any exceptions, the variable evaluates to empty content.
- `${DS}` - a dollar character ( `$` ). The variable evaluates to a plain dollar character ( `$` ) and is used when you need to escape this symbol so it is not treated as a prefix of a variable.
- `${CARET}` - indicated the position of the caret after generating and adding the comment.  
This `${CARET}` variable is applied only when a PHPDoc comment is generated and inserted during file creation. When a PHPDoc comment is created through Code | Generate | PHPDoc block, multiple selection of functions or methods is available so documentation comments can be created to several classes, functions, methods, or fields. As a result, IntelliJ IDEA cannot "choose" the block to apply the `${CARET}` variable in, therefore in this case the `${CARET}` variable is ignored.
- `${DATE}` - the current system date.
- `${YEAR}` - the current year.
- `${MONTH}` - the current month.
- `${DAY}` - the current day of the month.

Treating dollar sign

- You can prevent treating dollar characters ( `$` ) in template variables as prefixes. If you need a dollar character ( `$` ) inserted as is, use the `${DS}` file template variable instead. When the template is applied, this variable evaluates to a plain dollar character ( `$` ).  
Examples:
  - To use some version control keywords (such as `$Revision$`, `$Date$`, etc.) in your default class template, write `${DS}` instead of the dollar prefix ( `$` ).
  - The template code `${DS}this` will be rendered as `$this`.

Reformat according to style	Select this checkbox, to have IntelliJ IDEA reformat generated stub files according to the style defined on the <a href="#">Code Style page</a> . This option is only available in the Files tab.
-----------------------------	--

Enable Live Templates	Select this checkbox to use a live template inside a file template. So doing, one has to put the live template fragments into Velocity escape syntax. For example: <pre>#[[ \$MY_VARIABLE\$ \$END\$ ]]</pre> Thus, one can specify the cursor position. Note that it is required to use the <a href="#">live template variables</a> here!
-----------------------	---

Description This read-only field provides information about the template, its predefined variables, and the way they work.

Specify the settings for the template that you are creating.

#### ItemDescription

---

**Save** If the project that you are saving as a template contains more than one module, you can select to create a template for the whole project, or to include only for one of the modules in the template. So select <whole project> or the name of the corresponding module.  
This option is not available if your project contains only one module.

---

**Name** Specify the name of the template.

---

**Description** Type the template description.  
You can enclose text fragments between <b> and </b>, and <i> and </i> to make the corresponding fragments bold or italicized. For example:

```
A project with a <b>Java</b> module and support for <i>Web development</i> and <i>Tomcat</i>.
```

---

**Replace parameters with placeholders** If you select this checkbox (recommended), you will have additional options when creating a new template-based project or module. For example, you will be able to specify the base Java package and an application server different from the ones defined in the current project.

Use this dialog to select the necessary files or folders.

The dialog name and the available functions depend on the task you are performing at the moment (inappropriate functions are normally disabled). For example, depending on the situation, you may be able to select only one item, or a number of items. There may be cases when you can select a folder or folders but cannot select a file or files, etc.

- [Main functions](#)
- [Path field](#)
- [Using drag-and-drop from a file browser](#)

## Main functions

Most of the functions available in this dialog are accessed by means of the toolbar icons (shown in the **Icon** column).

Alternatively, you can use context menu commands (accessed by right-clicking items in the tree; listed in the **Command** column) or keyboard shortcuts (the **Shortcut** column).

### IconCommandShortcutDescription

Icon	Command	Shortcut	Description
	Home		Use this icon, command or shortcut to select your home directory. For example, on Windows, this may be <code>C:\Users\ &lt;your_name&gt;</code> .
	Desktop		Use this icon, command or shortcut to select the Desktop directory
	Project		Use this icon, command or shortcut to select your project root directory.
	Module		Use this icon, command or shortcut to select the root directory of the current module.
	New Folder		Use this icon, command or shortcut to create a new folder in the selected folder.
	Delete		Use this icon, command or shortcut to delete the selected file or folder.
	Refresh		Use this icon, command or shortcut to synchronize the tree with the current state of the file system. (Under certain circumstances, IntelliJ IDEA may not be aware of the changes made externally unless you use this command.)
	Show or Hide Hidden Files and Folders		Use this icon or command to turn showing hidden files and folders on or off.
	Show Quick List		Use this icon or command to show a list of all JDKs available on your computer. This icon is only available when selecting a JDK.
	Hide or Show path		Use this command or shortcut to hide or show the <a href="#">path field</a> . (The command is located on the toolbar in the right-hand part of the dialog and is shown as a hyperlink.)

## Path field

The path field (if not hidden) is located underneath the toolbar. This field shows the path to the item selected in the tree.

By using the path auto-completion feature available in this field, you can quickly navigate through the file system to select the necessary file or folder.

To activate path auto-completion, place the cursor in the field and press . Start typing. A pop-up will appear showing the contents of the current directory. Select an item in the pop-up. Continue typing and selecting until the necessary item is selected.

Use the  button to the right to show the history list of recent entries.

## Using drag-and-drop from a file browser

You can quickly locate and select the necessary file or folder if you drag the corresponding item from your file browser (Explorer, Finder, etc.) into the area where the tree is shown.

Use this dialog to set up a [library](#) .

- If the necessary files ( `.jar` ) are already available on your computer, you can arrange those files in a library and use that new library. To do that, select Use library , click Create and select the necessary files in the [dialog that opens](#) . (Use the `Ctrl` key for multiple selections.)  
Optionally, click Configure to edit your new library. (The [Create Library dialog](#) will open.)
- You can also download the necessary files and use those files as a library. To do that, select Download .  
Optionally, click Configure to edit the library settings and contents. (The [Downloading Options dialog](#) will open.)

Analyze | Analyze Dependencies

Analyze | Analyze Backward Dependencies

Analyze | Analyze Dependency Matrix

Analyze | Infer Nullity

Use this dialog box to define the scope for the search of dependencies or nullable elements. The contents of the dialog boxes slightly differ depending on the type of analysis.

#### ItemDescription

Whole project	Select this option to perform the analysis for the whole project.
Module <name>	Select this option to have IntelliJ IDEA analyze the module that is currently selected in the Project tool window.
File <name>	Select this option to analyze the file that is currently selected in the Project tool window or opened in the editor.
Selected files	Select this option to analyze the files that are currently selected in the Project tool window.
Uncommitted files	<p>This scope is only available for the projects under version control.</p> <p>Select this option to have IntelliJ IDEA analyze only files that have not been committed to the version control system. Use the drop-down list to further limit the analysis scope. The available options are:</p> <ul style="list-style-type: none"><li>– All - select this option to have files from all changelists analyzed.</li><li>– Default - select this option to have IntelliJ IDEA analyze only files from the Default changelist.</li></ul>
Custom scope	<p>Select this option to use a custom scope. Select a pre-defined scope from the drop-down list, or click  and define the scope in the <a href="#">Scopes dialog</a>.</p> <p><b>Tip</b> Use a special <a href="#">language</a> to define a scope.</p>
Include test sources	Select this check box to perform analysis on the test sources.
Scope of interest	<p>From this drop-down list, select the scope to seek for backward dependencies.</p> <p><b>Tip</b> The field is available for the <a href="#">backward dependencies</a> analysis only.</p>
Show transitive dependencies. Do not travel deeper than	<p>Select this check box to have IntelliJ IDEA analyze transitive dependencies. From the Do not travel deeper than drop-down list, choose the desired level.</p> <p><b>Tip</b> The field is available for the <a href="#">dependencies</a> analysis only.</p>
Annotate local variables	<p>If this check box is selected, then the local variables of a class will be included in the nullity analysis, and annotated.</p> <p><b>Tip</b> The field is available for <a href="#">inferring nullity</a> only.</p>

Use this dialog box to launch the search for duplicated code fragments in the specified scope.

**ItemDescription**

---

Whole project    Select this option to perform the analysis for the whole project.

---

Module  
<name>            Select this option to have IntelliJ IDEA analyze the module that is currently selected in the Project tool window.

---

File <name>        Select this option to analyze the file that is currently selected in the Project tool window or opened in the editor.

---

Selected files      Select this option to analyze the files that are currently selected in the Project tool window.

---

Uncommitted files    This scope is only available for the projects under version control.  
  
Select this option to have IntelliJ IDEA analyze only files that have not been committed to the version control system. Use the drop-down list to further limit the analysis scope. The available options are:  
– All - select this option to have files from all changelists analyzed.  
– Default - select this option to have IntelliJ IDEA analyze only files from the Default changelist.

---

Custom scope        Select this option to use a custom scope. Select a pre-defined scope from the drop-down list, or click  and define the scope in the [Scopes dialog](#) .

 Use a special [language](#) to define a scope.

Include test sources    Select this check box to perform analysis on the test sources.

---

Specify the scope for code cleanup. (Code cleanup means finding potentially problematic code fragments and automatically fixing them right away.)

**ItemDescription**

---

Whole project	Select this option if you want to perform code cleanup for the whole project.
Uncommitted files	This option is only available for projects under version control. Select this option if you only want to perform code cleanup for the files that have not yet been committed to a version control system, and choose a changelist from the drop-down list.
File <file path>	Select this option to perform code cleanup for the file that is open in the editor or selected in the Project tool window.
Module <module name>	Select this option to perform code cleanup for the module that is currently selected in the Project tool window. This option is only available, when <a href="#">a IntelliJ IDEA project consists of several modules</a> .
Directory <directory path>	Select this option to perform code cleanup for the directory currently selected in the Project tool window.
Selected files	Select this option to perform code cleanup for the files selected in the Project tool window.
Custom scope	Select this option to specify a custom scope. Select one of the predefined scopes from the drop-down list, or click  and define the scope in the <a href="#">Scopes</a> dialog that opens. For instructions on how to define a scope, refer to <a href="#">Scope Language Syntax Reference</a> .
Include test sources	Select this option to apply code cleanup to test sources.
Inspection profile	Select the inspection profile to be used. Choose a pre-defined profile from the drop-down list, or click  and configure a profile in the <a href="#">Inspections</a> dialog that opens. You can open the <a href="#">Inspections</a> dialog to check which fixes will be applied to the selected scope when you run code cleanup.

Use this dialog box to define the scope to apply inspection to and the profile against which the source code should be inspected.

Note that the list of scopes varies depending on the project type.

#### ItemDescription

Whole project	Select this option to perform the analysis for the whole project.
File <name>	Select this option to analyze the file that is currently selected in the Project tool window or opened in the editor.
Selected files	Select this option to analyze the files that are currently selected in the Project tool window.
Uncommitted files	<p>This scope is only available for the projects under version control.</p> <p>Select this option to have IntelliJ IDEA analyze only files that have not been committed to the version control system. Use the drop-down list to further limit the analysis scope. The available options are:</p> <ul style="list-style-type: none"><li>– All - select this option to have files from all changelists analyzed.</li><li>– Default - select this option to have IntelliJ IDEA analyze only files from the Default changelist.</li></ul>
Custom scope	<p>Select this option to use a custom scope. Select a pre-defined scope from the drop-down list, or click  and define the scope in the <a href="#">Scopes dialog</a>.</p> <p><b>Tip</b> Use a special <a href="#">language</a> to define a scope.</p>
Include test sources	Select this check box to perform analysis on the test sources.
Inspection profile	<p>Select a profile to inspect the specified scope against.</p> <p>A profile is selected from the drop-down list. If the desired profile is not in the list, click the ellipsis button and configure the desired profile on the <a href="#">Inspections</a> page of the Settings dialog.</p>

This feature is only supported in the Ultimate edition.

Edit | Find | Search Structurally

Edit | Find | Replace Structurally

Use these dialog boxes to find and replace fragments of code that structurally match the suggested [search template](#).

**Tip** To learn more about the possible usages, refer to the section [Structural Search and Replace](#).

Item	Description	Available in
Search template	Use this text area to specify the <a href="#">template</a> to be sought for. You can type the template code in the field or click the Copy existing template button to use one of the existing templates.	Both
Replacement template	Use this text area to specify the <a href="#">template</a> to be substituted. You can type the template code in the field or click the Copy existing template button to use one of the existing templates.	Structural Replace
Save template	Click this button to open the Save Template dialog box, where you have to specify the name of the new template. Note that the new template is stored under the User Defined node of the existing templates tree view.	Both
Edit variables	Calls the <a href="#">Edit variables</a> dialog box to set constraints for template variables.	Both
History	Click this button to open the History dialog box, that shows up to 25 last invoked templates.	Both
Copy existing template	Click this button to open the Existing Templates dialog box, where you can select one of the pre-defined or custom templates. Selected template is displayed in the Preview field. Clicking OK in the Existing Templates dialog box inserts the source code of the template into the Search template or Replace template field.	Both
Recursive matching	If this checkbox is selected, the search is performed recursively in the results.	Structural Search
Case sensitive	If this checkbox is selected, the search discerns lower and upper case letters.	Both
File type	Select file type from the drop-down list.	Both
Shorten fully qualified names	This option makes sense in case the template text contains fully qualified class names. If the checkbox is selected, IntelliJ IDEA automatically reduces these names in the template. Otherwise, fully qualified class names are used.	Structural Replace
Reformat according to style	Check this option, if you want IntelliJ IDEA to automatically reformat the expanded code fragment according to your code style settings (for details, refer to the <a href="#">Code Style</a> dialog box). If the option is not checked, IntelliJ IDEA will only indent the whole template according to the position in code at which it is expanded, leaving its formatting as is.	Structural Replace
Use static import if possible	Check this option, if you want IntelliJ IDEA to shorten any references to static elements in the replaced code. IntelliJ IDEA will insert a static import for those elements. The elements are then referenced by their short name. If there are no references to static elements in the replaced code, the option will be ignored.	Structural Replace
Scope	Select one of the existing scopes from the drop-down list or click the ellipsis button (alternatively, press <code>Shift+Enter</code> ), and create your own scope in the <a href="#">Scopes</a> dialog box.	Both
Open in new tab	If this checkbox is selected, the results of the new search display in a new tab in the Find results tool window. Otherwise, the search results update the existing tab.	Both

This feature is only supported in the Ultimate edition.

Edit | Find | Search Structurally | Edit variables

Use this dialog to define constraints for the variables of a [search template](#) .

**Tip** The contents of the dialog box depend on the selected variable type.

#### ItemDescription

Variables	This area shows a list of variables used in the current search template.
Text constraints	<p>In this area define the following constraints of the selected variable regarding text:</p> <ul style="list-style-type: none"><li>- Text/regular expression - in this text box, type a perl-like expression or a class name to be used as a variable constraint. Basic code completion is available for class names.</li><li>- Invert condition - select this checkbox to have the text pattern inverted.</li><li>- Apply constraint within type hierarchy - select this checkbox to have the search according to the pattern performed both in type names and in parents (within the hierarchy).</li><li>- Whole words only - when this checkbox is selected, only whole words within text are matched. This option recognizes string literals and comments.</li></ul>
Occurrences count	<p>In this area, define how pattern hits will be counted.</p> <ul style="list-style-type: none"><li>- Minimum count - in this text box, type the minimum number of elements in the list.</li><li>- Maximum count - in this text box, type the maximum number of elements in the list.</li><li>- Unlimited - select this checkbox to allow unlimited number of elements in the list.</li></ul>
Expression constraints	<p>In this area, define how expressions should be processed.</p> <ul style="list-style-type: none"><li>- Value is read - if this checkbox is selected, the matching variable is to be read.</li><li>- Value is written - if this checkbox is selected, the matching variable is to be written.</li><li>- Expression type (regexp) - if the calculated variable is an expression, this constraint checks its type. For instance, for the <code>foo(\$a\$)</code> expression the type of the method parameter would be checked.</li><li>- Expected type of expression (regexp) - if the calculated variable is matched to any expected type of an expression, this constraint checks the expression type anywhere the expression was used. For instance, correspondence between the method parameter type (e.g. <code>\$a\$</code> ) in method calls will be checked for methods like <code>foo(\$a\$)</code> .</li><li>- Apply constraint within type hierarchy - select this checkbox to have the search according to the pattern performed both in type names and in parents (within the hierarchy).</li><li>- Invert condition - select this checkbox to have the value of the corresponding checkbox changed to the opposite one.</li></ul>
Script constraints	<p>In this area, define a variable constraint via a script. Specify the script in the text box or click the  button to open the Edit Groovy Script Constraint dialog box. The constraint is applied after the initial matching process is finished.</p>
This variable is target of the search	<p>If this checkbox is selected, the search results will show not the entire expression but the selected variable(s) only.</p>

This feature is only supported in the Ultimate edition.

Edit | Find | Search Structurally | Edit variables | Complete Match

---

Use the Complete Match dialog to define constraints for the entire pattern that you have specified in the [search template](#) .

#### ItemDescription

---

Text constraints	<p>In this area define the constraints of the selected variable regarding text. In case of Complete Match this area might not be useful.</p> <p>The constraints are as follows:</p> <ul style="list-style-type: none"><li>- Text/regular expression - in this text box, type a perl-like expression or a class name to be used as a variable constraint. Basic code completion is available for class names.</li><li>- Invert condition - select this checkbox to have the text pattern inverted.</li><li>- Apply constraint within type hierarchy - select this checkbox to have the search according to the pattern performed both in type names and in parents (within the hierarchy).</li><li>- Whole words only - when this checkbox is selected, only whole words within text are matched. This option recognizes string literals and comments.</li></ul>
------------------	---

---

Contained in constraints	<p>In this area, define additional constraint pattern inside the already defined search template. Specify the pattern in the text box or click the <input type="button" value="..."/> button to open the Existing Templates dialog box. Invert condition - select this checkbox to have the value of the corresponding field changed to the opposite one.</p>
--------------------------	---

---

Script constraints	<p>In this area, define a variable constraint via a script. Specify the script in the text box or click the <input type="button" value="..."/> button to open the Edit Groovy Script Constraint dialog box. The constraint is applied after the initial matching process is finished.</p>
--------------------	---

---

This variable is target of the search	<p>If this checkbox is selected, the search results will show not the entire expression but the selected variable(s) only.</p>
---------------------------------------	--

Ctrl+Shift+F6

**ItemDescription**

Migrate type	Use this drop-down list to specify the new type.
Choose scope	Use this drop-down list to specify the migration scope. Click the Browse button  , if necessary.
Refactor	Click this button to launch refactoring to all usages in the specified scope. If there are any conflicts, IntelliJ IDEA will notify you about them.
Preview	Click this button to open <a href="#">Type Migration Preview</a> where you can browse items to be changed, exclude/include them from refactoring, and view the conflicts detected.

Use this dialog box to initiate validation of the debugger setup in a local or remote environment. In the context of IntelliJ IDEA, the term **remote** denotes any environment outside the project root. This can be a server on physically remote host, or a **Vagrant box**, or a server on the same machine but in a folder outside your project root.

**ItemDescription**

---

**Local Web Server or Shared Folder** Choose this option to check a debugger associated with a local Web server.

- Path to Create Validation Script: In this field, specify the absolute path to the folder under the server document root where the validation script will be created. For Web servers of the type **Inplace**, the folder is under the project root. The folder must be accessible through **http**.
- URL to Validation Script: In this text box, type the URL address of the folder where the validation script will be created. If the project root is mapped to a folder accessible through **http**, you can specify the project root or any other folder under it.

---

**Remote Web Server** Choose this option to check a debugger associated with a remote server.

- Path to Create Validation Script: In this field, specify the absolute path to the folder under the server document root where the validation script will be created. The folder must be accessible through **http**.
- Deployment Server: In this field, specify the server access configuration of the type **Local Server** or **Remote Server** to access the target environment. For details see [Configuring Synchronization with a Web Server](#). Choose a configuration from the drop-down list or click the Browse button  in the **Deployment dialog**.

---

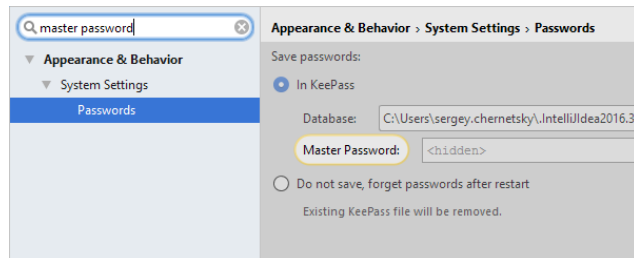

**Validate** Click this button to have IntelliJ IDEA create a validation script, deploy it to the target remote environment, and run it there.

Ctrl+Alt+S 

**Note** The settings that pertain to the current project, are marked with the  icon.

The Settings dialog lets you control every aspect of the IntelliJ IDEA behavior and appearance.

Use the search box in the upper-left part of the dialog to find the options of interest. Alternatively, you can browse the settings using the hierarchical list of categories (groups of settings) underneath the search box.

On this page find the descriptions of the main [controls](#) of the dialog.

#### ItemDescription

<a href="#">Search</a>	Enter a search keyword in the text area. While typing the search string, the list of options in the dialog reduces to the matching occurrences.
	Click this button to clear the search area.
OK	Apply changes and close the dialog box.
Cancel	Discard changes and close the dialog box.
Apply	Apply changes and leave the dialog box opened.
Help	Show reference page.

- [Appearance and Behavior](#)
- [Keymap](#)
- [Editor](#)
- [Plugins settings](#)
- [Version Control](#)
- [Build, Execution, Deployment](#)
- [Languages and Frameworks](#)
- [Tools](#)

Ctrl+Alt+S 

---

When you select the Appearance and Behavior category in the left-hand pane, its main subcategories are listed in the right-hand part of the dialog.

- [Appearance](#)
- [Menus and Toolbars](#)
- [System Settings](#)
- [File Colors](#)
- [Scopes](#)
- [Notifications](#)
- [Quick Lists](#)
- [Path Variables](#)

Ctrl+Alt+S 

Use this page to change the overall look and feel of your IDE.

## UI Options

### OptionDescription

Theme	Use this drop-down list to select the desired theme from the list.
Adjust colors for red-green vision deficiency	Select this option to adjust the IDE colors (code highlighting in the editor, text notifications, etc.) for people with the red-green color deficiency. For more information, see <a href="#">Color-Deficiency Adjustment</a> .
Override default fonts by (not recommended)	Select this checkbox to enable specifying font family and size to be used instead of the default one. When first installed, IntelliJ IDEA takes Windows default font size and style.
Cyclic scrolling in list	Select this checkbox to enable scrolling through a list by jumping from the last item to the first one and vice versa.
Show icons in quick navigation	Select this checkbox to have icons shown in the <a href="#">quick navigation</a> pop-up menu (  /  /  ) .
Automatically position mouse cursor on default button	Select this checkbox to have the mouse pointer placed at the default button when a dialog box opens. If the checkbox is not selected, the pointer location does not change.
Hide navigation popups on focus loss	If this checkbox is selected, the navigation pop-up frames ( <a href="#">go to class/file/symbol</a> ) close, when any other IntelliJ IDEA component gets the focus. If this checkbox is not selected, the navigation pop-up frames persist on changing the focus, and the only way to close such pop-up lays with pressing  .
Drag-n-Drop with ALT pressed only	If this checkbox is not selected (by default), IntelliJ IDEA allows moving editor tabs, tool window buttons, files and folders in the <a href="#">Project Tool Window</a> , using drag-n-drop.  Select this checkbox to avoid accidental moving of a file or folder, or a UI component. Thus drag-n-drop only works while ALT key is pressed.
Tooltip initial delay (ms)	Use this slider to specify the time to pass between the moment you hover the mouse over an item in the editor and the moment when the tooltip with its value appears. This settings is especially important during debugging. If the delay is too short using the mouse becomes inconvenient because every mouse move across the screen brings forward a number of tooltips with the values of all the variables.

## Antialiasing

### OptionDescription

IDE	From this drop-down list, select which antialiasing mode you want to apply to the IDE (including menus, tool windows, etc.): <ul style="list-style-type: none"> <li>Subpixel : this option is recommended for LCD displays and takes advantage of the fact that each pixel on a colour LCD is composed of red, green and blue sub-pixels. This allows smoothing text and rendering it with greater detail.</li> <li>Greyscale : this option is recommended for non-LCD displays or displays positioned vertically. It deals with text at the pixel level.</li> <li>No antialiasing : this option can be used for displays with high resolution, where non-antialiased fonts are rendered faster and may look better.</li> </ul>
Editor	From this drop-down list, select which antialiasing mode you want to apply to the <a href="#">Editor</a> : <ul style="list-style-type: none"> <li>Subpixel : this option is recommended for LCD displays and takes advantage of the fact that each pixel on a colour LCD is composed of red, green and blue sub-pixels. This allows smoothing text and rendering it with greater detail.</li> <li>Greyscale : this option is recommended for non-LCD displays or displays positioned vertically. It deals with text at the pixel level.</li> <li>No antialiasing : this option can be used for displays with high resolution, where non-antialiased fonts are rendered faster and may look better.</li> </ul>

## Window Options

### OptionDescription

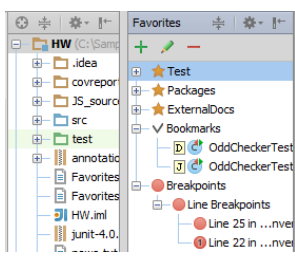

Animate windows	Select this checkbox to have undocked tool windows slide with the animation effect. This option applies only when a tool window is undocked.
Show memory indicator	Select this checkbox to show the Memory Indicator on the <a href="#">Status Bar</a> .
Disable mnemonics in menu	Select this checkbox to hide underlining of hot keys in the IntelliJ IDEA menus.

- Disable mnemonics in controls** Select this checkbox to hide underlining of hot keys in the IntelliJ IDEA controls.
- Display icons in menu items** If this checkbox is selected (by default), the icons are displayed to the left of the menu commands.  
If this checkbox is not selected, the menu commands are displayed without icons.

**Side by side layout on the left/right** When these checkboxes are selected, the way the tool windows are positioned is optimized for a wide-screen display.  
Side-by-side layout is OFF:

Side by side layout is ON:

Toggle layout by `Ctrl+MouseClicked` on splitter between the tool windows.  
This only applies to the tool windows located on the left and right sides, but not at the top and bottom of the IntelliJ IDEA window.

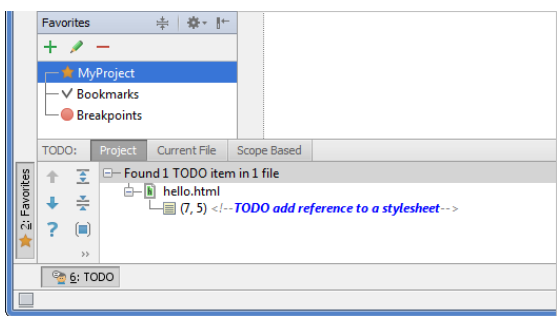

- Smooth scrolling** Select this option to enable by-pixel scrolling instead of by-line scrolling when you turn your mouse wheel.
- Show tool window bars** Select this checkbox to display tool window bars.
- Show tool window numbers** Select this checkbox to show tool window quick access numbers on the tool window buttons.  
You can use the `Alt+number` shortcuts regardless of this setting and change the shortcuts on the [Keymap page](#).  
  
Note that the tool window mnemonics show up only when the corresponding keybindings have the format `Alt+n`, where `n` is an integer number in the range from 1 to 9. In the case of a different keyboard shortcut, the mnemonics are not displayed.

**Allow merging buttons on dialogs** If this checkbox is selected, the multiple commands in a dialog box are grouped under a single button with a down arrow. You can view all merged commands by clicking the drop-down list, or pressing `Shift+Alt+Enter`.  
If this checkbox is not selected, the buttons will be shown in a row. Compare:

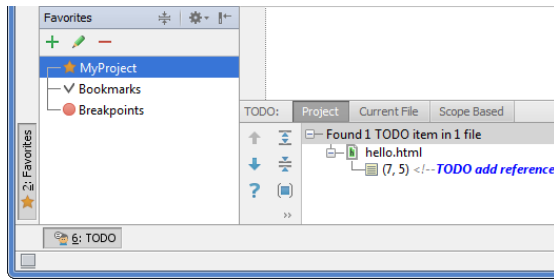

**Small labels in editor tabs** If this checkbox is selected, the font size on the editor tabs is set to the smaller value.  
If this checkbox is not selected, the font size on the editor tabs is set to the default value, as in the project tree view.

**Widescreen tool window layout** If this checkbox is selected, the way the tool windows are positioned is optimized for a wide-screen display.  
Widescreen tool window layout is OFF:

Widescreen tool window layout is ON:

**Note** That this is effective for macOS and for Windows with some mouse devices.

## Presentation Mode

### ItemDescription

---

Font size Use the drop-down list to select the font size for the [presentation mode](#) .

Ctrl+Alt+S 

Use this page to configure the IntelliJ IDEA [menus and toolbars](#) .

## Menus and Items List

The list shows the items for the menus and toolbars. The items are grouped according to the areas of their use.

To configure an item, expand the corresponding node and select the desired item. After that, the buttons in the right-hand part of the page become available.

## Controls

### ItemDescription

Add After	Click this button to add a new action to the menu after the selected one. In the Choose Actions to Add dialog box that opens choose the desired action and optionally assign an icon to it.
Add Separator	Click this button to have a separator added to the menu after the selected item.
Edit Action Icon	Click this button to associate an icon with the selected menu item. In the Choose Action Icon Path dialog box that opens specify the path to the desired image. <div data-bbox="258 712 975 801" style="background-color: #ffff00; padding: 5px;"><b>Tip</b> – The image file should have <code>.png</code> extension. – The size of the toolbar icons should be 16x16.</div>
Remove	Click this button to delete the selected item from the list.
Move Up	Click this button to move the selected item one position up.
Move Down	Click this button to move the selected item one position down.
Restore All Defaults	Click this button to abandon all the changes made to the all items and return to the default settings.
Restore Default	Click this button to abandon all the changes made to the selected item and return to the default settings.

The dialog box opens when you select an item in the Menus and Items List and click the Add After button.

In the dialog box, choose the desired action to be added to the menu or toolbar and optionally assign an icon to it.

#### ItemDescription

---

**Action List** The list shows all the actions available in IntelliJ IDEA. The actions are grouped below nodes according to the areas of their use.

---

**Icon Path** In this text box, specify the location of the file with the icon you want to assign to the selected action. If necessary, use the Browse button  to select the file in the [corresponding dialog](#) .

**Tip**

- The image file should have `.png` extension.
- The size of the toolbar icons should be 16x16.

---

**Set Icon** Click this button to associate the selected action with the icon specified in the Icon Path dialog box.

Ctrl+Alt+S 

Use this page to configure general behavior of IntelliJ IDEA.

## Startup/Shutdown

### ItemDescription

Reopen last project on startup	Select this checkbox to have IntelliJ IDEA re-open the last opened project on startup.
Confirm application exit	Select this checkbox to have a warning message displayed when you attempt to close IntelliJ IDEA.

## Project opening

### ItemDescription

Open project in a new window	Click this radio button to always open a new project in a new window.
Open project in the same window	Click this radio button to always close the current project, and reuse the same window.
Confirm window to open project in	Click this radio button to have IntelliJ IDEA ask you whether you want to open a new project in the same frame, or in a new one.

## Synchronization

### ItemDescription

Synchronize files on frame or editor tab activation	If this checkbox is selected, all the files that were changed externally are reloaded from disk when you switch to IntelliJ IDEA from a different application, or when you switch to their editor tab.
Save files on frame deactivation	If this checkbox is selected, all modified files are auto saved when you switch from IntelliJ IDEA to a different application. Note that you cannot disable autosave completely by turning off this and the following option. See also, the <a href="#">Saving and Reverting Changes</a> section.
Save files automatically if application is idle for N seconds	If this checkbox is selected, all modified files are auto saved at regular time intervals. See also, the <a href="#">Saving and Reverting Changes</a> section.
Use "safe write" (save changes to a temporary file first)	If this checkbox is selected, a changed file is first saved in a temporary file. If the save operation succeeds, the file being saved is replaced with the saved file. (Technically, the original file is deleted and the temporary file is renamed.)  Also, the ownership of such file changes. If this checkbox is not selected, the ownership of a file does not change, but all the advantages of safe write will be lost.

## Accessibility

### ItemDescription

Support screen readers (requires restart)

## On Closing Tool Windows with Running Process

### ItemDescription

Terminate	If this option is selected, the running process disconnects and terminates silently.
Disconnect (if available)	If this option is selected, the running process is disconnected.
Ask	If this option is selected, the dialog box shows up:

Ctrl+Alt+S 

Specify whether IntelliJ IDEA should save your passwords - ones you use to access password-protected resources such as version control repositories and databases.

When you use [KeePass password manager](#), the master password will be used to access a file that stores individual passwords. Once IntelliJ IDEA remembers your passwords, it will not ask for the passwords again including the master password unless you need to access the password database.

Under Save passwords, you can configure password settings.

#### ItemDescription

In native Keychain	<p>IntelliJ IDEA displays this option for macOS and Linux only.</p> <p>Select this option to use native Keychain for storing your passwords.</p>
In KeePass	<p>Select this option to use the <a href="#">KeePass password manager</a> for storing your passwords.</p>
Database	<p>This field displays the location of your current <code>c.kdbx</code> file. If you need to select another location, click  and in the <a href="#">dialog</a> that opens, choose the appropriate one.</p> <p>If you want to import another <code>c.kdbx</code> file, click  icon and from the drop-down list select Import. If you want to remove the existing passwords in the <code>c.kdbx</code> file, select Clear.</p>
Master Password	<p>Use this field to enter a password that you want to use for accessing <code>c.kdbx</code> file. The first time IntelliJ IDEA generates a password automatically.</p>
Do not save, forget password after restart	<p>Select this option if you want to remove the <code>c.kdbx</code> file containing individual passwords after the restart.</p>

This dialog opens only once when you launch a new IntelliJ IDEA version with configurations from the previous IntelliJ IDEA version.

IntelliJ IDEA lets you convert the current saved password database into a new one.

**ItemDescription**

---

**Password**      Use this field to enter a master password that you have used in the previous version of IntelliJ IDEA.

---

**Convert**      Click this button to store your saved passwords in a new password database.

---

**Clear Password**      If you click this button nothing will be converted and your old passwords will not be saved. The same action will be taken if you close this dialog without entering the master password.

Ctrl+Alt+S 

If to access the Internet IntelliJ IDEA should use an HTTP proxy, specify the proxy settings on this page.

**ItemDescription**

No proxy	Click this radio button to connect to the Internet without a proxy.
Auto-detect proxy settings	Click this radio button to enable using an auto-configuration URL to configure the web proxy settings. When this option is selected, the following controls become enabled: <b>ItemDescription</b> Automatic proxy configuration URL      Select this checkbox to manually specify the location of the proxy settings file, in case IntelliJ IDEA does not find it automatically. Clear passwords      Click this button to clear the passwords to the specified proxy.
Manual proxy configuration	Click this radio button to enable manual proxy configuration. When this option is selected, the following controls become enabled: <b>ItemDescription</b> HTTP      Click this radio button if you want IntelliJ IDEA to use an HTTP proxy when accessing the Internet. SOCKS      Click this radio button if you want IntelliJ IDEA to use the <a href="#">Socket Secure protocol</a> when accessing the Internet. Host name      Specify the proxy hostname or IP address. Port number      Specify the proxy port number. No proxy for      Specify here the patterns for the URLs or IP addresses, for which proxy should not be specified. Proxy authentication      Select this checkbox if your proxy requires authentication. Login      Specify the name of the user on whose behalf IntelliJ IDEA will connect to the proxy. Password      Specify the password associated with the user name (login). Remember password      Select this checkbox if you want IntelliJ IDEA to remember the password. Otherwise, you will be asked to provide the password every time IntelliJ IDEA connects to the proxy.

Ctrl+Alt+S 

Use this page to:

- Enable automatic update of IntelliJ IDEA and specify to which kind of release you want it updated.
- Obtain information about the current IntelliJ IDEA version and availability of a newer version.

#### ItemDescription

---

Automatically check for updates for	<p>Select this checkbox to enable the automatic update function, and select the desired update channel (for example, stable version).</p> <ul style="list-style-type: none"><li>- Channel <b>Early Access Program</b> : this channel gets patch from the previous EAP/release version. This is not recommended for production development. More details about the Early Access Program, or EAP, are available at <a href="http://eap.jetbrains.com/">http://eap.jetbrains.com/</a> .</li><li>- Channel <b>Beta Releases or Public Previews</b> : this channel includes release candidates (RC).</li><li>- Channel <b>Stable Releases</b> : this channel includes all IntelliJ IDEA releases, for example, IntelliJ IDEA X.Y.Z</li></ul> <p>Note that the list is only available for the <b>stable versions</b> . For the various EAPs, it is enforced to <b>Early Access Program</b> .</p>
Use secure connection	<ul style="list-style-type: none"><li>- If this checkbox is selected, the secure connection protocol ( <b>HTTPS</b> ) is used.</li><li>- If this checkbox is cleared, the <b>HTTP</b> protocol is used. Note that the <b>HTTP</b> protocol may be blocked due to security reasons.</li></ul> <p>By default, the checkbox is selected.</p>
Check Now	Click this button to check for updates immediately.
View/edit ignored updates	Follow this link to show/change the builds which were ignored on IntelliJ IDEA update. These build numbers are included in the list of ignored updates and not suggested any more.

**Tip** You can alternatively choose Help | Check for Updates (for Windows or \*NIX) or IntelliJ IDEA | Check for Updates (for macOS) on the main menu.

Ctrl+Alt+S 

---

Use this page to share the statistics of your IntelliJ IDEA usage with JetBrains.

**ItemDescription**

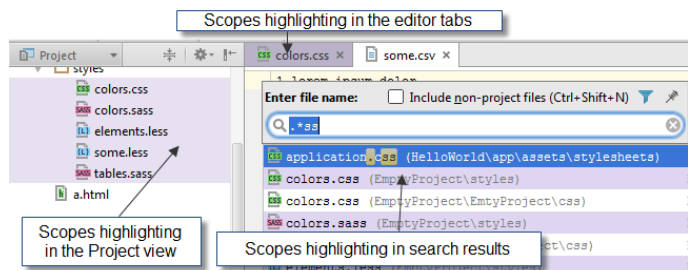

---

Allow to send usages statistics to JetBrains	Select this checkbox to allow JetBrains to collect your anonymous statistics.
Daily, Weekly or Monthly	Select one of these options to define how often your usage statistics should be sent to JetBrains.

Ctrl+Alt+S 

Use this page to set different background colors for distinguishing between project files, folders, and packages of specific [scopes](#). The settings apply to the following UI elements:

- The headers of editor tabs.
- [Navigation lists](#) when one searches for files or classes by their names
- [Project Tool Window](#)

## Common Options

### Item Description

Enable File Colors	Select this checkbox to apply background color settings to <a href="#">navigation lists</a> .
Use in Editor Tabs	Select this checkbox to apply background color settings to the headers of editor tabs.
Use in Project View	Select this checkbox to apply background color settings to the Project view.
Manage Scopes	Click this button to open the <a href="#">Scopes</a> dialog in which you can define custom scopes for various actions.

## Local Colors

In this area, configure the color-scope associations to be applied locally.

Once defined, a color-scope association cannot be changed. To re-assign a color to a scope, remove the existing association and define a new one.

### Item Tooltip Description

Scope	This read-only field shows the scope to apply the color setting to.	
Color	This read-only field shows the color to be applied to the corresponding scope.	
	Add	Click this button to open the Add Color Label dialog in which you can configure a new color-scope association.
	Remove	Click this button to remove the selected color-scope association.
	Move up or Move down	Use these buttons to resort the color-scope associations and thus determine the order in which they are applied.
	Share	Click this button to have the selected scope-color association shared among the members of the team. The selected association will be accordingly moved to the list in the <a href="#">Shared Colors</a> area.

## Shared Colors

Use the controls in this area to configure the color-scope associations to be shared among all the members of the team.

Once defined, a color-scope association cannot be changed. To re-assign a color to a scope, remove the existing association and define a new one.

### Item Tooltip Description

Scope	This read-only field shows the scope to apply the color setting to.	
Color	This read-only field shows the color to be applied to the corresponding scope.	
	Add	Click this button to open the Add Color Label dialog in which you can configure a new color-scope association.
	Remove	Click this button to remove the selected color-scope association.
	Move up or Move down	Use these buttons to resort the color-scope associations and thus determine the order in which they are applied.
	Unshare	Click this button to have the selected scope-color association applied only locally. The selected association will be accordingly moved to the list in the <a href="#">Local Colors</a> area.

Ctrl+Alt+S 

A scope is a set of files to which various operations apply. Using this dialog, you can define scopes for the various IntelliJ IDEA actions, for example, Find Usages, or Code Inspections.

## Main toolbar

### ItemTooltipDescription

	Add scope	Click this button to add a new local or shared scope.
		
	Delete	Click this button to delete the selected scope from the list.
		
	Copy configuration	Click this button to create a copy of the selected scope.
		
	Save as	Click this button to have the selected local scope saved as shared or a selected shared scope as local.
	Move Up/Move Down	Use these buttons to move the scopes up and down in the list. If some file is included into several scopes, the order of the scopes becomes important: IntelliJ IDEA uses the color of the uppermost scope (shown in the <a href="#">Scopes</a> settings page) to highlight such file. Of course, you can change the order of the scopes, and thus the resulted highlighting.

## Scope configuration controls

### ItemDescription

Name	In this text box, specify the scope name.
Pattern	<p>In this text box, specify the pattern that defines the current scope. The following elements and structures can be used:</p> <ol style="list-style-type: none"> <li>The <code>file:</code> modifier. The element is mandatory.</li> <li>The <code>*</code> asterisk to denote any symbol in a file name or file extension.</li> <li>Logical operators <code>AND (&amp;&amp;)</code>, <code>OR (  )</code>, and <code>NOT (!)</code>.</li> </ol> <p>For more information, see <a href="#">Scope Language Syntax Reference</a>.</p> <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>Type or edit the pattern manually in the text field <code>Pattern</code>.</li> <li>Click , or press  to type or edit in the expanded area. (Click  or press  to return to a single-line area.)</li> <li>Choose the desired files in the <a href="#">Project Tree View</a> and use the <a href="#">buttons described below</a> to make IntelliJ IDEA generate the corresponding pattern automatically.</li> </ul>

**Warning!** Storing empty or incorrect patterns is not allowed. In such cases, you will be prompted with the SyntaxError warning.

## Examples

- `file[MyMod]:src/main/java/com/example/my_package/*` - include in a project all the files from module "MyMod", located in the specified directory and all subdirectories.
- `src[MyMod]:com.example.my_package.*` - recursively include all classes in a package in the source directories of the module.
- `lib:com.company.*||com.company.*` - recursively include all classes in a package from both project and libraries.
- `test:com.company.*` - include all test classes in a package, but not in subpackages.
- `[MyMod]:com.company.util.*` - include all classes and test classes in the package of the specified module.
- `file:*.js||file:*.coffee` - include all JavaScript and CoffeeScript files.
- `file:*js&!file:*.min.*` - include all JavaScript files except those that were generated through minification, which is indicated by the `min` extension.

Include	Click this button to have the selected element included in the scope. The corresponding expression is automatically generated and added to the expression in the Pattern text box.
---------	--

**Tip** If the current element is a folder, the nested subfolders are ignored.

Include Recursively	Click this button to have the selected folder included in the scope, together with the nested subfolders. The corresponding expression is automatically generated and added to the expression in the Pattern text box.
---------------------	--

Exclude	Click this button to have the selected element excluded from the scope. The corresponding expression is automatically added to the Pattern. If the current element is a folder, the nested subfolders are ignored.
---------	--

Exclude Recursively	Click this button to have the selected folder excluded from the scope, together with the nested subfolders. The
---------------------	---

corresponding expression is automatically added to the Pattern field.

## Scope toolbar

### ItemTooltipDescription

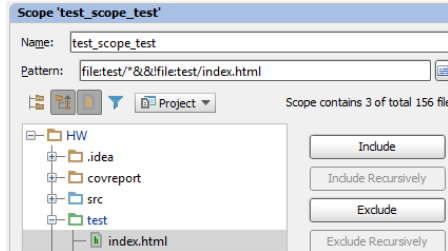

**Project tree view** The tree view contains all the files available in your project. In the view, select the desired files to be included in the current scope and have the scope definition pattern generated automatically. The message on the toolbar shows the total number of available files and the number of files included in the scope. See also the [color legend](#) below. Use the toolbar buttons described below to change the view presentation. The way of presentation of the project tree view, the available controls and [scopes language syntax](#) depend on the selection in project vs package drop-down list.

 **Flatten Packages** When the button is pressed, all the packages are displayed as a single-level tree view. This enables you to find a package somewhere deep within the project by its name without going through the entire tree hierarchy.

 **Compact Empty Middle Packages** This option lets you specify how or whether empty packages are to be shown. (Empty packages are ones that contain nothing but other packages.)

 **Group by** When this button is pressed, the items in the tree-view are grouped below three nodes:  
– Library Classes  
– Production Classes  
– Test Classes  
  
This button is only available for the Package presentation of scopes.

 **Show Files** If this button is pressed, source files are displayed explicitly in the tree view. When the files are shown, they can be selected for exclusion/inclusion into a pattern.

If this button is not pressed, the files are hidden.

 **Show Included Only** When the button is pressed, the tree shows only the elements that are included in the scope.

Use this drop-down box to define how you want the project files to be displayed in the tree view. The available options are:  
– Project  
– Packages

The project tree view presentation, [scopes language syntax](#) and the available toolbar buttons differ depending on the selection.

## Legend of the project tree view

### ItemDescription

-  Folders and files included in scope.
-  Folders and files excluded from scope.
-  Folders that contain both excluded and included files and subfolders.

Ctrl+Alt+S 

Use this page to enable and disable notifications about certain events, change their presentation, and optionally enable their logging.

#### ItemDescription

**Display balloon** Select this checkbox to enable event notifications for IntelliJ IDEA. (The notifications, generally, are shown in the balloons that appear on the screen when the corresponding events take place.)

**Enable system notifications** Select this checkbox to allow showing system notification.

**Warning:** This option is not available on platforms where system notifications are not supported (Windows and some Unixes).

**Group** This column lists groups of events that you may be notified of and/or that may be logged.

**Popup** If the Display balloon notification checkbox is selected, the settings in this column specify how the notifications for the corresponding group of events are shown.

The available display options are:

- Balloon : The balloons with the notification messages appear on the screen for a short period of time and then disappear automatically. The notifications are also shown in the Status bar, and added to the list of notifications.
- Sticky balloon : The notification balloons stay on the screen unless you close them.
- Tool window balloon : The notification balloons are shown only if an appropriate tool window is open.
- No popup : The notifications for the corresponding group of events are not shown.

**Log** If the checkbox for a group of events is selected, the corresponding events are logged and can be seen in the [Event Log tool window](#).

Use this page to configure quick lists. A Quick List is a pop-up menu of IntelliJ IDEA commands, configured by the user and associated with a keyboard or mouse shortcut. You can create as many quick lists as necessary. Each command, included in a quick list, is identified by a sequential number. Numbering starts from the numerals (0 to 9), and then proceeds with the letters in alphabetical order.

**Item ShortcutDescription**

		Create a new Quick List.
		Delete the selected Quick List.
Display name		Edit the name of the selected Quick List.
Description		Edit the description of the selected Quick List. (The description is optional.)
		Use this button to add actions to the Quick List. Select the actions in the Add Actions to Quick List dialog that opens.
		Use this button to add a separator at the end of the Quick List. (Separators help you organize menu commands in logical groups.)
		Remove selected actions from the Quick List.
		Use this button to move the selected item one line up in the list.
		Use this button to move the selected item one line down in the list.

Ctrl+Alt+S

On this page:

- [Path Variables page](#) . Use this page to configure [path variables](#) and the list of [ignored variables](#) .
- [Add / Edit Variable dialog](#) . Use this dialog to specify the name and value for a new or existing path variable.
- [Example](#) .

## Path Variables page

### ItemDescription

Reset	Use this link to revert path variables and the list of ignored variables to their initial saved states.
Name	This field shows the name of a path variable (readonly).
Value	This field shows the value of a path variable (readonly).
+ or 	Use this icon or shortcut to create a new path variable. (The <a href="#">Add Variable</a> dialog will open.)
 or 	Use this icon or shortcut to edit the selected path variable. (The <a href="#">Edit Variable</a> dialog will open.)
– or 	Use this icon or shortcut to delete the selected path variable.
Ignored Variables	List the names of the variables that should be <a href="#">ignored</a> . Use semicolons ( ; ) to separate individual list items.

## Add / Edit Variable dialog

### ItemDescription

Name	Specify the path variable name.
Value	Specify the path variable value. Use  (  ) to select the necessary file or folder in the <a href="#">Select Path dialog</a> .

## Example

Consider storing a library on your disk. This library is attached to your project, and the path to this library is included in the `*.iml` file of your project. However, this path should not be absolute, since the other teammates may store same library in the different locations.

That's why it makes sense to create a dedicated path variable `PATH_TO_LIB` :

1. On the Settings dialog, click [Path Variables](#) .
2. Click .
3. In the [Add Variable](#) dialog box, type the variable name `PATH_TO_LIB` , and its value that points to the library location on your disk.
4. Share the `*.iml` file on the version control.
5. The other developers should update their projects, and change the value of `PATH_TO_LIB` variable to point to the locations of their libraries.

Ctrl+Alt+S 

Use this page to create, edit, and remove custom keymaps for specific environments, and change shortcuts associated with actions.

Note that default keymaps are not editable. To re-configure shortcut associations, create a child keymap based on the desired default one and edit it as required.

On the other hand, as soon as you try to change a keyboard shortcut associated with an action in one of the default keymaps, a copy of the corresponding keymap is automatically created.

## Keymap Management Buttons

### ItemDescription

Keymaps	From this drop-down list, select the desired keymap.
Copy	Click this button to create a child keymap on the basis of the keymap selected in the Keymaps drop-down list.
Reset	Click this button to abandon all the changes made to a custom keymap and restore the configuration of the parent keymap.
Delete	Click this button to remove the selected custom keymap from the list.
Prefer key position over key char with national layout	This checkbox appears when a non-English keyboard layout has been detected (only available for MacOS). When this option is selected, key position is preferred over its meaning for keymap in national layouts.
Based on keymap	This read-only field shows the name of the parent keymap.

## Keymap Toolbar

### ItemTooltip Description and shortcut

	Expand All	Click this button to expand all nodes in the content pane of actions.
		
	Collapse All	Click this button to collapse all nodes in the content pane of actions.
		
	Edit Shortcut	Click this button to change shortcuts for the selected action. It is possible to remove existing shortcuts, and add new ones. Choose the desired change from the drop-down menu:
		

- Select the option Add Keyboard Shortcut to open the [Enter Keyboard Shortcut](#) dialog box, where you can specify the combination of keystrokes to be assigned to the selected action in the current keymap.
- Select the option Add Mouse Shortcut to open the [Enter Mouse Shortcut](#) dialog box, where you can specify the combination of mouse clicks and buttons to be assigned to the selected action in the current keymap.
- Select the options Remove <shortcut> to delete the selected shortcut from the selected action.

These commands are duplicated on the context menus of the actions in the Actions content pane.

 in 

Use this text box to search through the content pane of actions. As you type a search string, the actions that match the search pattern are displayed.

The previously used search patterns are stored in the search history list. To add the search string to the history list, press .

Click  to reveal the history list of the previous searches.

Click  to clear the current search pattern from the text box.

	Find Action by Shortcut	Click this button to open the Find Shortcut dialog to filter out the desired actions by keystrokes. Refer to the section <a href="#">Configuring Keyboard Shortcuts</a> to learn how to specify keyboard shortcuts. The actions with shortcuts that match the specified criteria are shown in the content pane of actions.
---	-------------------------	---

	Clear Filtering	Click this button to restore the initial list of actions in the content pane.
---	-----------------	---

## Actions

### ItemDescription

---

All Actions

This content pane shows all actions currently available in IntelliJ IDEA. The actions are grouped below nodes according to the areas of their use.

- Note that default keymaps are not editable. As soon as you try to change a keyboard shortcut associated with an action, a copy of the corresponding keymap is automatically created.
- If some of the actions have no mapped keyboard shortcuts, they still can be invoked by [Go to Action](#) .

---

Shortcuts

This read-only field shows the list of shortcuts associated with the selected action in the current keymap.

**Tip** The shortcuts are represented depending on the platform. However, some keys are missing on certain keyboard layouts. For example,  /  keys are not available on notebooks. That's why one should use plus arrow keys.

### Context menu of an action

---

Add Keyboard Shortcut

Choose this command on the context menu of an action to open the [Enter Keyboard Shortcut](#) dialog box, where you can specify the combination of keystrokes to be assigned to the selected action in the current keymap.

---

Add Mouse Shortcut

Choose this command on the context menu of an action to open the [Enter Mouse Shortcut](#) dialog box, where you can specify the combination of mouse clicks and buttons to be assigned to the selected action in the current keymap.

---

Add abbreviation

Choose this command to add an abbreviation that can be used in [Search Everywhere](#) .

---

Remove

Choose this command on the context menu of an action to delete the selected shortcut or abbreviation.

<shortcut>/<abbreviation>

The dialog box opens when you select an action and click the Add Mouse Shortcut button. Use this dialog box to bind the selected action with a new mouse shortcut, which may be a single or a double clicking one of the mouse buttons or the wheel button.

The resulting mouse shortcut is marked with the  icon in the Shortcuts list.

#### ItemDescription

---

**Click Count** In this area, specify the type of mouse click to be assigned to the selected action. The available options are:

- Single Click
- Double Click

---

**Click Pad** Click the desired mouse button anywhere in this area.

**Tip** The number of clicks in this area does not affect the shortcut configuration. No matter how many times you click a button, the click type chosen in the Click Count area will be assigned.

---

**Shortcut Preview** This read-only field shows the newly defined shortcut.

---

**Conflicts** This read-only field shows messages about conflicts that arise if a suggested mouse shortcut is already in use.

**Warning!** You can ignore a conflict and assign a shortcut to several actions. However it is strongly recommended that you avoid binding two actions with the same shortcut, because the priority of these actions is not defined.

The dialog box opens when you select an action and click the Add Keyboard Shortcut button. Use this dialog box to bind the selected action with a new keyboard shortcut, which may consist of one or two keystrokes. The resulting keyboard shortcut is marked with the  icon in the Shortcuts list.

**Warning!** Use your mouse pointer to click buttons in the dialog box. Any key stroke is interpreted as a shortcut!

#### ItemDescription

First stroke	Use this no-name field to define the primary shortcut by pressing keyboard keys and key combinations.
Second stroke	Select this checkbox to allow an optional second shortcut. Use the text box to the right to define an optional shortcut by pressing keyboard keys and key combinations. This field is available after the Second stroke checkbox is selected.
Conflicts	This read-only field shows messages about conflicts that arise if a suggested keystroke is already in use. Note that this field only appears if a conflict exists!

**Warning!** You can ignore a conflict and assign a shortcut to several actions. However it is strongly recommended that you avoid binding two actions with the same shortcut, because the priority of these actions is not defined.

Ctrl+Alt+S 

---

When you select the Editor category in the left-hand pane, its main subcategories are listed in the right-hand part of the dialog.

- [General](#)
- [Color Scheme](#)
- [Code Style](#)
- [Inspections](#)
- [File and Code Templates](#)
- [File Encodings](#)
- [Live Templates](#)
- [File Types](#)
- [Copyright](#)
- [Emmet](#)
- [GUI Designer](#)
- [Images](#)
- [Intentions](#)
- [Language Injections](#)
- [Spelling](#)
- [TextMate Bundles](#)
- [TODO](#)

Ctrl+Alt+S 

Use the General page of the Settings/Preferences dialog to configure the editor behaviour and customize its view.

**ItemDescription****Mouse**

**Honor "CamelHumps" word settings when selecting using double click** Select this checkbox to have IntelliJ IDEA invoke the CamelHumps selection when words are selected by double-clicking. This feature works only if the [Use 'CamelHumps' words](#) option is enabled.

**Change font size (Zoom) with Ctrl/Command+Mouse Wheel** If this checkbox is selected, a particular editor font size can be changed by [rolling the mouse wheel](#) while holding the  key. This checkbox also affects font size in [quick documentation lookup](#) .  
If this option is unchecked, rolling the mouse wheel while holding the  key scrolls the editor.

**Enable Drag'n'Drop functionality in editor** If this checkbox is selected, you can [drag-n-drop](#) code fragments in the editor.

**Soft Wraps**

**Use soft wraps in editor** If this checkbox is selected, soft wraps (or word wraps ) are used in the editor. The horizontal scroll bar is not normally shown when this option is enabled. However, in certain cases, when a line cannot be "soft-wrapped", the horizontal scroll bar still appears (for example, if a line consists of a single string that is wider than the visible area.)

**Use original line's indent for wrapped parts** Select this checkbox to use custom indentation for soft wraps on resizing the editor or console. Specify the indent value in the Additional shift text field on the right.

**Show soft wrap indicators for current line only** If this checkbox is selected, the soft wrap characters  will be shown in the active logical line only. Otherwise, soft wraps characters will be shown at the end of each line, and at the beginning of each next line.

**Virtual Space**

**Allow placement of caret after end of line** If this checkbox is cleared, the caret never rests after the last symbol in a line.

**Allow placement of caret inside tabs** Select this checkbox to allow placing the caret inside tab characters. The reason is that each tab character shows in the editor as a set of 'virtual' space characters.

**Show virtual space at file bottom** If this checkbox is selected, the currently edited line (even if it is the final line) can be scrolled to the top of the screen. IntelliJ IDEA adds the necessary amount of virtual lines.

**Other**

**Strip trailing spaces on Save** Select the mode in which IntelliJ IDEA will handle trailing spaces at the end of lines on file saving:  
– Modified lines : strips trailing spaces only in the end of modified lines.  
– All : strips trailing spaces in all lines.  
– None : does not strip trailing spaces.

**Always keep trailing spaces on caret line** If this option is selected, trailing spaces will not be stripped on the line where the caret is placed on save operation (for example, when you switch to another window).

**Ensure line feed at file end on Save** Select this checkbox to have IntelliJ IDEA automatically add an empty line in the end of a file during the save procedure.

**Show quick documentation on mouse move** Select this checkbox to [show quick documentation](#) for the symbol at caret. The quick documentation pop-up window appears after the specified delay.

**Highlight modified lines in gutter** Select this checkbox if you want added/modified lines to be highlighted with a color stripe in the left editor gutter.

**Different color for lines with whitespace-only modifications** This option only becomes available if the Highlight modified lines in gutter option is enabled. Select this checkbox if you want lines where only whitespaces were added/removed to be highlighted with a different color from lines with more significant modifications.

**Highlight on Caret Movement**

**Highlight matched brace** Select this checkbox to have IntelliJ IDEA highlight pairs of opening/closing braces when you position the caret right before the opening or right after the closing one. It also works for HTML and XML tags.

**Highlight current scope** Select this checkbox to have IntelliJ IDEA highlight the available scope for the code typed in the current caret location.

**Highlight usages of element at caret** Select this checkbox to have IntelliJ IDEA highlight all usages of the element at which the caret is currently positioned.

**Formatting**

**Show notification** Select this checkbox to show a notification with changes in your code and a shortcut to the [Reformat Code](#)

after reformat code action dialog every time you try to reformat the code. Otherwise, IntelliJ IDEA will reformat code silently.

Show notification after optimize imports action Select this checkbox to show notification with changes in your code. Otherwise, IntelliJ IDEA will optimize imports silently.

### Scrolling

Smooth scrolling If this option is enabled, the editor scrolls the page when you navigate to an element, instead of just jumping to the target location.

Prefer scrolling editor canvas to keep caret line centered Click this option to choose scrolling editor canvas and keeping the caret in place. Keeping the caret in place and scrolling the editor canvas can be helpful in course of [debugging session](#). As you step through the lines of code, the editor canvas scrolls, while the line at caret is always in the center of the screen.

Prefer moving caret line to minimize editor scrolling Click this option to choose moving the caret. When you step through the lines of code during the [debugging session](#), the caret moves down, and the editor canvas doesn't scroll until the caret line reaches the bottom of the screen.

### Refactorings

Enable in-place mode Select or clear this checkbox to enable or disable in-place refactorings for Java. The in-place in connection with the refactorings means specifying all or most of the information necessary for the refactoring by typing, right in the editor. All the affected code fragments are highlighted and change as you type. If appropriate, additional refactoring options are selected in corresponding option boxes.

The in-place refactoring mode is available for the following refactorings:

- [Extract Constant](#)
- [Extract Field](#)
- [Extract Parameter](#)
- [Extract Variable](#)
- [Rename](#)

If this checkbox is not selected, the refactoring settings for all of the refactorings are specified in the corresponding dialogs.

Preselect old name If this checkbox is selected, the old name of a symbol is selected when the [Rename refactoring](#) is invoked for that symbol.

```
//region m1
double inchesDouble = metersTo
String v ble.t
convert inchesDouble INVERS
convert inchesdouble you
//endregion
```

If checkbox is not selected, the symbol being renamed is not selected.

Show inline dialog for local variables Select this checkbox if you want to display a confirmation dialog for the "Inline local variable" refactoring.

### Limits

Maximum number of contents to keep in clipboard In this text box, specify how many code blocks can be kept in clipboard.

Recent file limit In this text box, specify how many file names can be included in the list of recent files.

### Rich-text copy

Copy as rich text by default Select this checkbox to copy a rich text from the editor to any other editor that recognizes RTF.

Note that you can override this option if you select Copy as Plain Text from the context menu in your editor and vice versa, using the Copy as Rich Text option from the context menu overrides the unselected checkbox in the editor settings.

Color scheme Use this drop-down list to select a color scheme for the text copy. You can select from the following options:  
- Default  
- Active scheme  
- Darcula

### Error highlighting

Error stripe mark min height (pixels) In this text box, specify the minimum size of the error and warning stripes.

Autoreparse delay (ms) In this text box, specify the time period after which IntelliJ IDEA starts reparsing the entered text.

'Next Error' action goes to high priority problems only Select this checkbox to have IntelliJ IDEA pass through the highest priority problems only (for example, errors), when executing `Navigate | Next/Previous Highlighted Error` command (`F2` / `Shift+F2`). Clear this checkbox to have IntelliJ IDEA pass through all the existing problems (for example, errors and warnings) sequentially.

Suppress with Select this checkbox to have `@SuppressWarnings` implemented as an annotation.

`@SuppressWarnings` Clear this checkbox to have `@SuppressWarnings` implemented as a JavaDoc comment.  
(for 5.0 only)

**Note** Significant trailing spaces which affect an output of a program, are not removed where applicable. For example, trailing spaces in the multiline strings in Groovy are not removed etc.

Ctrl+Alt+S 

## XML

Show import pop-up Automatically display an import pop-up dialog box when typing the name of an unbound namespace.

## Java

Insert imports on paste Use this drop-down list to define how IntelliJ IDEA will insert imports for pasted blocks of code, if they contain references to classes that are not imported into the target class.

The available options are:

- **All** - select this option to have IntelliJ IDEA automatically add import statements for all classes that are found in the pasted block of code and are not imported in the current class yet.
- **Ask** - if this option is selected, when pasting code blocks, IntelliJ IDEA will open a dialog box, where you can choose the desired imports.
- **None** - select this option to suppress import.

**Tip** If you skip an import suggested in the **Ask** mode or choose the **None** mode, the non-imported classes will be red-highlighted and an import pop-up window will appear to help you create import statements using the **Alt+Enter** keyboard shortcut.

Show import pop-up Automatically display import pop-up dialog box when typing the name of a symbol that lacks import statement.

Optimize imports on the fly Select this checkbox to have the [Optimize Imports](#) operation automatically performed for your files.

Add unambiguous imports on the fly Select this checkbox to have IntelliJ IDEA automatically add imports that can be added without user intervention.

Exclude from Import and Completion In this area, create a list of packages and classes that should not be automatically included in the import statements.

Note that you can exclude packages and classes both on the project level and on the IDE level. This can be done in the cells of the Scope column:

Use:

- **+** (**Alt+Insert**) to enter the name of the class/package to be excluded from import and completion.
- **-** (**Alt+Delete**) to remove the selected item from the list.

**Tip** IntelliJ IDEA allows using an asterisk wildcard to define the classes/packages to be excluded.

## TypeScript/JavaScript

Add ES6 imports automatically

**Tip** Auto import in ES6 works only when the ECMAScript 6 language level is chosen on the [JavaScript](#) page (File | Settings | Languages and Frameworks | JavaScript for Windows and Linux or IntelliJ IDEA | Preferences | Languages and Frameworks | JavaScript for macOS).

- If this checkbox is selected, IntelliJ IDEA automatically inserts an `import` statement in JavaScript code when you complete a symbol exported using ES6 exports in another project file:

- When the checkbox is cleared, on pressing **Alt+Enter** IntelliJ IDEA shows a pop-up that suggests to import the completed symbol:

```

1  export default class Invoice {
2    constructor() {
3      new Customer()
4    }
5  }
6

```

- Completion and auto import also work for React components, including stateless components. IntelliJ IDEA properly detects them, provides code completion, and adds `import` statements automatically:

```

1  import React from 'react'
2
3  import { ColorWrap } from './common'
4
5  export const Github = ({ width, colors, onChange, triangle }) => {
6    const handleChange = (hex, e) => onChange({ hex, source: 'hex' }, e)
7
8    return (
9      <div className="github-picker">
10         |
11       </div>
12     )
13   }
14
15   Github.defaultProps = {

```

Add TypeScript imports automatically

- If this checkbox is selected, IntelliJ IDEA automatically inserts an `import` statement in TypeScript code when you complete a symbol exported in another project file.
- When the checkbox is cleared, on pressing `Alt+Enter` IntelliJ IDEA shows a pop-up that suggests to import the completed symbol.

## JSP

Add unambiguous imports on-the-fly

Select this checkbox to have IntelliJ IDEA automatically add imports that can be added without user intervention.

## Scala

**Note** This table is only available when Scala plugin is downloaded and installed. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

Insert imports on page

Use this drop-down list to define how IntelliJ IDEA will insert imports for pasted blocks of code, if they contain references to classes that are not imported into the target class. The available options are:

- **All** - select this option to have IntelliJ IDEA automatically add import statements for all classes that are found in the pasted block of code and are not imported in the current class yet.
- **Ask** - if this option is selected, when pasting code blocks, IntelliJ IDEA will open a dialog box, where you can choose the desired imports.
- **None** - select this option to suppress import.

**Tip** If you skip an import suggested in the **Ask** mode or choose the **None** mode, the non-imported classes will be red-highlighted and an import pop-up window will appear to help you create import statements using the `Alt+Enter` keyboard shortcut.

To disable import import pop-up, use Java settings

Refer to the same options in the settings for Java.

Add unambiguous imports on the fly

Select this checkbox to have IntelliJ IDEA automatically add imports that can be added without user intervention.

Optimize imports on the fly

Select this checkbox to have the [Optimize Imports](#) operation automatically performed for your files.

## PHP

**Note** This table is only available when PHP plugin is downloaded and installed. The plugin is not bundled with IntelliJ IDEA, but it can be installed from the [JetBrains plugin repository](#) as described in [Installing, Updating and Uninstalling Repository Plugins](#) and [Enabling and Disabling Plugins](#).

Enable auto-import in file scope

Select this checkbox to have IntelliJ IDEA automatically import PHP namespaces, add `use` statements, and [complete short class names](#) on the fly, when you are typing in a class or file that does not belong to any specific namespace. By default, the checkbox is cleared.

Enable auto-import in namespace scope

Select this checkbox to have IntelliJ IDEA automatically import PHP namespaces, add `use` statements, and [complete short class names](#) on the fly when you are typing in a class or file that belongs to a certain namespace. The checkbox is selected by default.

Enable auto-import from global space

When this checkbox is selected, IntelliJ IDEA automatically adds `use` statements for classes, functions, and constants from the `global namespace`, for example, `Exception`, `is_array()`, `strlen()` etc.

When this checkbox is cleared, no `use` statement for such classes, functions, and constants is added. By default, the referenced symbol is not prepended with a backslash. To have a backslash inserted automatically, select the `Prepend functions and constants from the global space with '\'` checkbox.

Prepend functions and constants from the global space with '\'

The checkbox is available only when the Enable auto-import from global space is cleared. When the checkbox is selected, IntelliJ IDEA automatically prepends called functions and referenced constants from the `global namespace` with a backslash.

When the checkbox is cleared, no backslashes are added.

---

To keep your code easy to read and increase productivity by avoiding additional loops during name resolution, select either the Enable auto-import from global space or the Prepend functions and constants from the global space with '\' checkbox. See [PHP name resolution rules](#) for more details.

Ctrl+Alt+S

Use this page to enable or disable specific smart keys and to define which actions you want to be invoked automatically.

**ItemDescription**

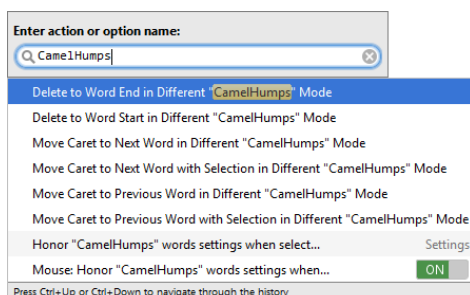

Home	When this checkbox is selected, on pressing <code>Home</code> , the caret is positioned at the first non-space character of the current line. Pressing <code>Home</code> subsequently moves the caret from the <i>Smart Home position</i> to the first column and back.
End (on blank line)	When this checkbox is selected, on pressing <code>End</code> in an empty line, the caret is positioned with the indent, which IntelliJ IDEA assumes to be reasonable in the current code point (indentation is based on the current <a href="#">Code Style Settings</a> ).
Insert pair bracket	Select this checkbox to have IntelliJ IDEA automatically add a closing round or square bracket for each typed opening round or square bracket, respectively.
Insert pair quote	Select this checkbox to have IntelliJ IDEA automatically add a closing single or double quote for each typed opening single or double quote, respectively.
Reformat block on typing "}"	If this checkbox is selected, then, on typing the closing curly brace, the enclosed code block is reformatted automatically, if the formatting of this code block does not match the selected code style.
Use 'CamelHumps' words	Select this checkbox to have IntelliJ IDEA discern separate words within CamelHump names. Words within a name should start with a capital letter or an underscore. This option impacts some editor actions, for example: <ul style="list-style-type: none"> <li>- <b>Caret Move</b> (<code>Ctrl+Right</code> / <code>Ctrl+Left</code>)</li> <li>- <b>Caret Move with Selection</b> (<code>Ctrl+Shift+Right</code> / <code>Ctrl+Shift+Left</code>)</li> <li>- <b>Select Word at Caret</b> (<code>Ctrl+W</code>)</li> <li>- <b>Delete to Word Start/End</b> (<code>Ctrl+Backspace</code> and <code>Ctrl+Delete</code> respectively)</li> <li>- <b>Double-clicking</b> (if Honor "CamelHumps" word settings when selecting using double click is enabled on the Editor   General settings page).</li> </ul>

IntelliJ IDEA also provides similar actions that work in a mode opposite to the one selected in the Use 'CamelHumps' words setting:

- Move Caret to Previous Word in Different "CamelHumps" mode
- Move Caret to Previous Word with Selection in Different "CamelHumps" mode
- Move Caret to Next Word in Different "CamelHumps" mode
- Move Caret to Next Word with Selection in Different "CamelHumps" mode
- Delete to Word End in Different "CamelHumps" mode
- Delete to Word Start in Different "CamelHumps" mode

For example, if Use 'CamelHumps' words is *enabled*, the action **Move Caret to Next Word in Different "CamelHumps" mode** moves the caret to the end of word regardless of uppercase characters in this word; if Use 'CamelHumps' words is *disabled*, then the caret moves to the next CamelHump within this word.

These actions have no default keyboard shortcuts, and are not included in the menus but you can invoke them from **Go to Action** (`Ctrl+Shift+A`):

You can bind them with the shortcuts of your choice as described in the section [Configuring Keyboard Shortcuts](#).

Surround selection on typing quote or brace	If this checkbox is selected, the selected text on typing a quote, double-quote or brace, will be surrounded with these characters. If this checkbox is not selected, then the typed quotes, double-quotes or braces will replace the selection.
---	--

Add multiple carets on double <code>Ctrl</code> / <code>⌘</code> with arrow keys	If this checkbox is selected, then: <ul style="list-style-type: none"> <li>- pressing <code>Ctrl</code> (for Windows or *NIX) or <code>⌘</code> (for macOS) twice plus up/down arrow keys leads to creating multiple carets.</li> <li>- pressing <code>Ctrl</code> (for Windows or *NIX) or <code>⌘</code> (for macOS) twice plus left/right arrow keys or Home/End leads to creating a selection.</li> </ul>
--	---

For more information, see the [Multicursor](#) section.

Enter	Use this area to define the actions to be invoked by pressing <code>Enter</code> . <ul style="list-style-type: none"> <li>- <b>Smart Indent</b> - select this checkbox to have IntelliJ IDEA add a new line and position the caret in it, with the indent that IntelliJ IDEA assumes to be reasonable in the current point of code (indentation is based on the current <a href="#">Code Style</a> settings).</li> <li>If the checkbox is cleared, upon pressing <code>Enter</code> in a blank line, IntelliJ IDEA adds a new line and positions</li> </ul>
-------	---

the caret at the current non-space character column.

- **Insert pair '}'** - select this checkbox to have IntelliJ IDEA automatically position a closing brace `}` at the proper column when `Enter` is pressed in an empty line. In this case IntelliJ IDEA seeks backward for the nearest unclosed opening brace `{` and places the closing one at the corresponding indentation level.
- **Insert documentation comment stub** - this check box defines the behavior on pressing `Enter` after an opening documentation tag.
  - If this checkbox is selected, IntelliJ IDEA generates a documentation comment stub.  
For the method comments, this stub contains the required tags ( `@param` tags for each method parameter, `@return` , or `@throws` ). Refer to [Creating Documentation Comments](#) and [Creating JSDoc Comments](#) for details.  
  
For the function comments, this stub contains the required tags ( `@param` tags for each parameter declared in the signature, and `@return` ). Refer to [Creating JSDoc Comments](#) for details.
  - If this checkbox is not selected, only the closing tag is generated.

**Warning!** Note that this checkbox refers to JavaScript, Java and the other languages that have special beginning of documentation comments.

**Backspace** Use this drop-down list to define the actions to be invoked by pressing `Backspace` key. The available options are:

- **Disabled** - pressing `Backspace` returns the caret by one position at a time.
- **To nearest indent position**
- **To proper indentation**

**Reformat on paste** Use this drop-down list to specify how to place pasted code blocks. The available options are:

- **None** - The pasted code is inserted at the caret location as plain text without any reformatting or indenting.
- **Indent Block** - The pasted code block is positioned at the proper indentation level, according to the current [Code Style Settings](#) , but its inner structure is not changed.
- **Indent Each Line** - Each line of the pasted code block is positioned at the proper indentation level, according to the current [Code Style Settings](#) .
- **Reformat Block** - The pasted code block is reformatted according to the current [Code Style Settings](#) .

**Tip** This feature is applicable to lines that contain the trailing line feed characters.

**XML/HTML** In this area, define the actions to be invoked automatically when editing XML or HTML code.

- **Insert closing tag on tag completion** : select this checkbox to have IntelliJ IDEA automatically insert a closing XML or HTML tag upon entering the corresponding opening one.
- **Insert required attributes on tag completion** : select this checkbox to have IntelliJ IDEA display a template with all mandatory attributes of the typed tag.
- **Insert required subtags on tag completion** : select this checkbox to have IntelliJ IDEA display a template with all mandatory subtags.
- **Start attribute on tag completion** : select this checkbox to have IntelliJ IDEA display a template with the first mandatory attribute of the typed tag.
- **Add quotes for attribute value on typing '='** : select this checkbox to have IntelliJ IDEA automatically add quotes for the value of the attribute that you are currently typing.
- **Auto-close tag on typing '</'** : select this check box to automatically add a closing tag after entering `</`. Clear this checkbox to turn off such auto-completion.
- **Simultaneous `<tag></tag>` editing** :
  - When this checkbox is selected and you edit an opening tag the corresponding closing tag is automatically changed accordingly.
  - If this checkbox is cleared, editing the opening tag does not affect the closing tag which remains unchanged. As a result, the opening and closing tags do not match and the entire construct is underlined as erroneous.

This checkbox controls the behaviour of IntelliJ IDEA in the following contexts:

- HTML files
- HTML injections within JavaScript code
- HTML with templates [Handlebars](#)/[Mustache](#) templates
- Handlebars/Mustache template files with the extension `.hbs`
- XML, XHTML files
- DTD files
- JSX files
- JSP files
- HTML injections in PHP files

**CSS** In this area, define the selection of CSS identifiers/classes:

- **Select whole CSS identifier on double-click** : If this checkbox is selected, double-click on a CSS identifier or class name selects the entire name up to the prefix

`.ic-arrow-left`

If this checkbox is not selected, double-click on a CSS identifier or class name selects a portion of a name up to the nearest hyphens:

`.ic-arrow-left`

**AngularJS** Use this area to define the behavior of AngularJS:

- **Auto-insert white space in the interpolation** : If this checkbox is selected, a white space is automatically inserted between the braces: `{{ }}` .

If this checkbox is not selected, the white space is not inserted: `{{}}` .

---

Javadoc

In this area, define the behavior of the closing tags in Javadoc.

- Automatically insert closing tag - select this checkbox to make IntelliJ IDEA insert closing tag automatically, after typing `>` . So doing, the caret rests inside the tag. For example, if you type `<b>` , the closing tag `</b>` will be generated automatically.

---

SQL

Insert string concatenation on Enter. You may want to turn this option off, if the DBMS you are working with supports multiline string literals:

Say, there is the following fragment for PostgreSQL `text` value `notes` :

```
SET notes = 'Lightest element'
```

and the cursor is in front of the word `element` .

If the option is on, and you press `Enter` , the fragment will change to:

```
SET notes = 'Lightest ' ||
           'element'
```

Otherwise, the fragment will change to:

```
SET notes = 'Lightest
element'
```

Qualify object on code completion. The selected option defines how the name of an object is inserted in the editor when using the code completion suggestion box.

- Always. The qualified object names are always used, i.e. `<schema_name>.<object_name>` .
- On collisions. The qualified object name is used only if the short name is ambiguous, e.g. when there is the object with the same name in more than one schema.
- Never. The unqualified object names are always used.

---

Insert pair '%>' on Enter in JSP

Select this checkbox to have IntelliJ IDEA automatically position the opening angle bracket `<` at the proper column when entered in an empty line in JSP code. In this case IntelliJ IDEA seeks backward for the nearest unclosed angle bracket and places a closing one `>` at the corresponding indentation level.

---

PHP

Use this area to define the behavior of the editor in the PHP context:

- Enable smart function parameter completion : when this checkbox is selected, you can use the "automatic" live template that provides completion lists for the parameters passed into functions, methods, or class constructors.

To invoke the magic live template, type the `params` keyword as the first parameter in the call of the function, method, or class:

```
$result = foo(params);
           (smart function parameters completion) [Tab]
           pg_parameter_status(connection : null|resource .. string
```

IntelliJ IDEA displays a live template where the parameters are automatically completed with the variable names defined in the function declaration. To move to the next parameter, press `Enter` or `Tab` . To move to the previous parameter, press `Shift+Tab` .

The completion list contains variables from a local scope in the next order: with the same type, with a similar name, defined nearby. You can always switch to the usual completion mode by pressing `Ctrl+Space` or just typing anything which is not in the list. Variables with similar names are inserted automatically.

- Select variable name without `$` sign on double click : when this check box is selected, only the variable name that follows the `$` sign is selected on double click or pressing `Ctrl+W` . This is helpful if you often need to copy variable names without `$` : just double-click and copy the selection.

If you still need a variable name with `$` selected, place the cursor before the `$` sign and double click it or press `Ctrl+W` .

Ctrl+Alt+S 

Use this page to customize the appearance of the Editor.

**ItemDescription**

Caret blinking (ms)	Select this checkbox to make the caret blink with the specified period (in milliseconds).
Use block caret	Select this checkbox to have the block caret applied in the Insert mode and the usual caret applied in the Overwrite mode.  Clear this checkbox to have the usual caret applied in the Insert mode and the block caret applied in the Overwrite mode.
Show right margin (configured in Code Style options)	Select this checkbox to have a thin vertical line at the right margin of the editor displayed. Refer to the description of the <a href="#">Code Style settings</a> .
Show line numbers	Select this checkbox to have line numbering shown in the left gutter area.
Show method separators	Select this checkbox to have thin lines displayed in classes to separate methods from each other and to separate methods from field declarations.
Show whitespaces	Select this checkbox to have IntelliJ IDEA display white spaces or tabs (depending on the <a href="#">Code Style settings</a> ).  You can select the following options: – Leader - select this checkbox to add white spaces before your code line. – Inner - select this checkbox to display white spaces inside the line of your code. – Trailing - select this checkbox to display white spaces after the code line.

Show vertical indent guides	Select this checkbox to have IntelliJ IDEA display vertical lines in the editor to indicate positions of indents and thus facilitate typing, manual formatting, reading, and maintaining code.
-----------------------------	--

Show code lens on scrollbar hover	Select this checkbox to enable <a href="#">lens mode</a> .
-----------------------------------	--

Show breadcrumbs	Select this checkbox to show a breadcrumb trail on top of the editor tab for an HTML or an XML file. Reopen the editor for the changes to take effect.
------------------	--

```
topic content table conditional tr td
```

(XML)

```
html body table tr td
```

(HTML)

Show parameter name hints	If the checkbox is selected, the parameter name hints appear in the editor for SQL, Java and Groovy. E.g. the column name hints may be shown for SQL INSERT statements.
---------------------------	---

```
1 INSERT INTO family (member_id, name, relation) VALUES
2 ( member_id: 1, name: 'Chloe', relation: 'mother');
```

Here is how the same statement is shown when this checkbox is not selected.

```
1 INSERT INTO family (member_id, name, relation) VALUES
2 (1, 'Chloe', 'mother');
```

Click Configure to change the contents of the Blacklist. See [Type Hinting in IntelliJ IDEA](#).

Show CSS color preview icon in gutter	Select this checkbox to show color preview icons for the color values. See <a href="#">Changing Color Values in Style Sheets</a> .
---------------------------------------	---

```
#header h1{
  color: #0000ff;
}
#body bodytext{
  color: brown;
}
color: #a52a2a
```

If this checkbox is not selected, it is still possible to invoke the color picker and change color values, by choosing the Change color intention action.

```
s.css x
body {
  background: #ffffff;
  color: #3f3f3f;
}
Change color
Convert color to HSL
Convert color to RGB
```

Show CSS color preview as background	If this checkbox is selected, the background of the color value shows the color preview.
--------------------------------------	--

```

some.css x
1 body{
2   background: #010203;
3   color: blue;
4 }

```

Enable XML/HTML tag tree highlighting

Select this checkbox to show the hierarchy of tags highlighted with different colors. If this option is enabled, you can define the following options:

- Levels to highlight : specify the depth of hierarchy to be highlighted.
- Opacity : specify brightness of highlighting

```

sample.html x
html body ul li ul li
<ul>
  <li>Level 1
    <ul>
      <li>Level 2</li>
      <ul>
        <li>Level 3</li>
        <li>This is a hierarchy high
      </ul>
    </ul>
  </li>
</ul>

```

Highlighting is activated when there is more than one tag with the same name in the hierarchy.

Highlight RDoc and ruby in comments  
This feature is only supported, when Ruby plugin is installed!

If this checkbox is selected, the keywords are highlighted in comments. Otherwise, they are displayed as plain text.  
Changing state of this checkbox takes effect upon IntelliJ IDEA restart only.

Show Spring Profiles panel

If this checkbox is selected, Spring configuration files show the active profile names on top of the editor. This panel also provides the Change Profiles action.

```

transfer-service-config.xml x DefaultTransferServiceTests.java x TransferService.java
Active profiles: "production" Change Profiles Close
<bean id="transferService" class="com.bank.service.internal.DefaultTransferService"...>

```

Clicking this action opens up the Change Active Spring Profiles dialog where you can choose a scope to which you want to apply the selected profiles.

If there are no profiles in a file set, the panel is not displayed.

Show Spring Multiple Contexts panel

If this option is selected, a panel notifying you that a file belongs to different filesets is displayed.

```

additional-spring-configuration-metadata.json x qqqq.xml
Spring Application Context in module hello spring boot . File is included in 4 contexts.
<?xml version="1.0" encoding="UTF-8" ?>
<beans xmlns="http://www.springframework.org/schema/beans"

```

Clicking the Spring Application Context link allows you to switch between different contexts.

Show Spring Boot meta-data panel

If this option is selected, a panel notifying you that Spring Boot Configuration Annotation Processor is not found in classpath will be displayed when you create a top-level class annotated with `@ConfigurationProperties` or the `additional-spring-configuration-metadata.json` file.

```

application.properties x m demo x CustomConfigProperties.java x additional-spring-configuration-metadata.json x
Spring Boot Configuration Annotation Processor not found in classpath Open Documentation...
package demo;

```

Ctrl+Alt+S 

---

Use this page to enable or disable breadcrumbs for all supported languages or for some of them. Optionally customize the placement for breadcrumbs in the editor and highlighting for them.

#### ItemDescription

---

**Show breadcrumbs** When this checkbox is selected, breadcrumbs are shown in the contexts selected in the Languages area:

`DataStructure` `EvenIterator` `next()`

When this checkbox is cleared, the Placement and Languages areas are disabled.

---

**Placement** In this area, choose whether you want to have breadcrumbs at the top or at the bottom of the editor. The default option is Bottom .

---

**Languages** Select the checkboxes next to the language contexts where you want to have breadcrumbs.

---

**Manage colors** Click this link to open [Color Scheme](#) page and configure colors for highlighting breadcrumbs.

Ctrl+Alt+S 

Use this page to configure the appearance of the editor tabs and tab headers, specify their positioning on the screen, and define the tab closing policy.

**ItemDescription**

## Tab Appearance

**Placement** Use this drop-down list to define the location of the editor tab. The available options are:

- Top - the default setting.
- Bottom
- Right
- Left
- None - select this option to have single editor without any tabs displayed.

Refer to the section [Changing Placement of the Editor Tab Headers](#) for details.

**Show tabs in single row** Select this checkbox to have headers of currently opened editor tabs displayed in a single row. As a result, some tab headers may become invisible. To cope with this problem, use the command Window | Editor Tabs | Show All Tabs . Refer to the section [Navigating Between Editor Tabs](#) .

If this checkbox is selected, the [sorting in alphabetical order](#) mode becomes available for the top and bottom placement of the editor tabs.

If this checkbox is not selected, headers of all the currently opened tabs are displayed, possibly, in several rows.

**Hide tabs if there is no space** If this checkbox is selected, IntelliJ IDEA shows as many tabs as fits into the current IntelliJ IDEA frame; the rest of the tabs are hidden under the  drop-down:

If this checkbox is not selected, all the editor tabs are shown; so doing, each tab's size reduces:

This checkbox becomes enabled when Show tabs in single row checkbox is selected.

**Hide file extensions in editor tabs** Select this checkbox to have only file names displayed in editor tab headers.

**Show directory in editor tabs for non-unique file names** If this checkbox is selected, the editor tabs will show the file name together with the parent directory name; if this checkbox is not selected, only the file name will be included in the editor tab.

**Show "close" button on editor tabs** Select this checkbox to have the Close Active Editor button  displayed in editor tab headers.

**Mark modified tabs with asterisk** If this checkbox is selected, changed but yet unsaved files have an asterisk  on their editor tabs.

**Show tabs tooltips** If this checkbox is selected, a tooltip with the complete path to a file displays on hovering the mouse pointer over a tab.

If this checkbox is not selected, a tooltip is not shown.

## Tab Closing Policy

**Tab limit** In this text box, specify the maximum number of the editor tabs to display.

**Navigation from non-modified tab will reuse it** Use this option to specify the IntelliJ IDEA behaviour on . This option allows you to avoid [cluttering of the editor space](#) .

If this checkbox is **selected** , then, if a file in an editor tab has not been modified and the users has navigated from this file, the target file opens in the same tab. If a file has been modified, then the target file opens in a new tab.

If this checkbox is **not selected** , the target file always opens in a new tab.

Note that a file is considered modified if its [VCS status has changed](#) .

**When number of opened editors exceeds tab limit** In this area, specify which editor tab should be closed when the tab limit is reached and the user attempts to open a new file. The available options are:

- Close non-modified files first - if this option is selected, IntelliJ IDEA examines the tabs in the order they were opened and closes the first tab with content that has not been modified.
- Close less frequently used files - if this option is selected, IntelliJ IDEA closes the tab with the less frequently modified content.

**When closing** In this area, specify which editor tab to activate when closing the currently active tab. The available options are:

active editor

- Activate left neighbouring tab - if this option is selected, IntelliJ IDEA activates the closest tab to the left from the tab being closed.
- Activate right neighbouring tab - if this option is selected, IntelliJ IDEA activates the closest tab to the right from the tab being closed.
- Activate most recently opened tab - if this option is selected, IntelliJ IDEA activates the tab with the file which was opened last.

Ctrl+Alt+S 

---

Use this page to hide or show the icons in the gutter area that invoke actions related to the basic, IntelliJ IDEA-wide features or to framework- and technology-specific features for all the newly created editors.

The right-hand pane shows all the gutter icons available in IntelliJ IDEA. The basic, IntelliJ IDEA-wide features, such as  (Run), are displayed at the top of the list under the Common title. Other features are grouped by the frameworks and technologies to which they are related, for example, Groovy, Spring Support, etc.

Note that a group of technology-related features is displayed only if the corresponding plugin is installed and activated, see [Enabling and Disabling Plugins](#) and [Installing, Updating and Uninstalling Repository Plugins](#) for details.

- To have an icon displayed in the gutter area, find the icon or the corresponding action in the list and then select the checkbox next to it.
- To have an icon hidden, clear the checkbox next to it.

Ctrl+Alt+S 

---

Use this page to specify your [code folding](#) preferences.

**ItemDescription**

---

Show code folding outline    Select this checkbox if you want the code folding toggles (⌵, ⌶ and ⌷) to be shown in the editor. Clear the checkbox to hide the toggles.

---

Collapse by default    Select the code fragments which should be folded by default, that is, when a file is first opened in the editor.

Ctrl+Alt+S 

Use this page to configure the [code completion](#), and [parameter information](#) settings.

**ItemDescription**

## Code Completion

**Case sensitive completion** From this drop-down list, select the degree to which you want IntelliJ IDEA to take into consideration the case sensitivity when suggesting matches for code completion. The available options are:

- **All** : The lookup list includes only those items that match the case of all typed letters. This option is most restrictive.

- **None** : The lookup list includes all matches regardless of their case.

- **First letter** : The lookup list includes only the items with the first letter matching.

**Auto-insert when only one choice on:** When the checkboxes in this section are selected, IntelliJ IDEA doesn't show a lookup list for the corresponding completion type in cases when only one variant of code completion is available, and completes code automatically.

**Sort lookup items lexicographically** If this checkbox is selected, the entries in the suggestion list will be sorted according to their lexical order.

If this checkbox is not selected, the entries in the suggestion list will be sorted by relevance. Note that the checkbox defines the default behavior. You can change it any time by clicking the  or  icons in the [suggestion list](#).

**Autopopup code completion** Select this checkbox, if you want suggestion list to appear after typing anything.

If the checkbox is not selected, IntelliJ IDEA will not suggest code completion automatically.

**Insert selected variant by typing dot, space, etc.** If this checkbox is selected, code is completed by pressing certain character: comma, colon, semicolon, opening parentheses of the various kinds, equality sign, asterisk. This option is turned off by default.

**Autopopup documentation (ms)** Select this checkbox to have IntelliJ IDEA automatically show a pop-up window with the documentation for the class, method, or field currently highlighted in the lookup list. In the text field to the right, specify the delay (in milliseconds), after which the pop-up window should appear.

**For explicitly invoked completion** If this checkbox is not selected, use  to show quick documentation for the element at caret.

Quick documentation window will automatically pop up with the specified delay in those cases only, when code completion has been invoked explicitly. For the automatic code completion list, documentation window will only show up on pressing .

## Parameter Info

**Autopopup in (ms)** Select this checkbox to have IntelliJ IDEA automatically show a pop-up window with all available method signatures, when an opening bracket is typed in the editor, or a method is selected from the lookup list. In the text field to the right, specify the delay (in milliseconds) after when the pop-up window should appear.

If this checkbox is not selected, use  to show the parameter info.

**Show full signatures** If this checkbox is selected, the parameter info displays full signatures, including the method name and returned type.

Ctrl+Alt+S 

## Overview

**Postfix code completion** lets you transform an already typed expression to another one based on the postfix you type after a dot, the type of the expression, and its context. This transformation is performed by expanding the postfix-specific predefined template.

For example, the `.if` postfix applied to an expression wraps it with an `if` statement.

### Before/After

<pre>function m(arg) {   arg.if }</pre>	<pre>function m(arg) {   if (arg) {   } }</pre>
---	---

See more at: [Postfix Code Completion](#).

On this page, enable and disable postfix templates and appoint the key to activate the template expansion.

## Controls

### Item/Description

Enable postfix completion	<ul style="list-style-type: none"> <li>– Select this checkbox to have IntelliJ IDEA transform expressions with postfixes into other expressions by expanding postfix-specific templates. When the checkbox is selected, choose the postfixes to apply transformations to by selecting the checkboxes next to the desired postfixes in the list below.</li> <li>– When this checkbox is cleared, no template expansion is applied.</li> </ul>
Expand template with	From this drop-down box, choose the key that will invoke template expansion. The available options are: <code>Tab</code> , <code>Space</code> , and <code>Enter</code> .
Table of available postfix templates	The table below shows the list of available postfix templates. To enable or disable a template, select or clear the checkbox next to it. When you select a template, the right-hand pane shows its description and illustrates how it works by displaying the expression before and after the selected template is applied.

Ctrl+Alt+S 

Use this page to define lines to be folded in consoles. This lets you hide extraneous information and make console output easier to read and comprehend.

#### ItemDescription

Use soft wraps in console	If this checkbox is selected, soft wraps (or word wraps ) are used in consoles.
Console commands history size	In this text box, specify how many console commands will be included in the console history and can be browsed through.
Override console cycle buffer size (1024 KB)	Select this checkbox if you want to delete old messages when the console buffer size exceeds the specified value.
Fold console lines that contain	In this area, configure a list of patterns that determine the lines to be hidden in console output. Any line that contains one of these patterns as a substring is hidden. Use the following icons or shortcuts:

#### IconKeyboard Description shortcut

	 Use this icon or shortcut to open the Folding Pattern dialog box and type a new pattern.
	 Use this icon or shortcut to open the Folding Pattern dialog box and edit the selected pattern.
	 Use this icon or shortcut to remove the selected pattern from the list.

Exceptions	In this area, configure a list of patterns that determine the lines not to be folded in console output. Any line that contains one of these patterns as a substring is displayed. Use the following icons or shortcuts:
------------	---

#### IconKeyboard Description shortcut

	 Use this icon or shortcut to open the Folding Pattern dialog box and type a new pattern.
	 Use this icon or shortcut to open the Folding Pattern dialog box and edit the selected pattern.
	 Use this icon or shortcut to remove the selected pattern from the list.

Ctrl+Alt+S 

Use this section to select the color scheme for the IntelliJ IDEA editor.

#### ItemDescription

Scheme	From this drop-down list, select the color scheme to be used in your workspace.
	<p>Click this button to invoke the following commands (depending on the selected scheme):</p> <ul style="list-style-type: none"><li>- Duplicate : click to save the currently selected Color settings as a new scheme. Hit <code>Enter</code> to save the new scheme, or <code>Escape</code> to cancel operation.</li><li>- Restore Defaults : click to reset the selected color scheme to the initial defaults shipped with IntelliJ IDEA. Available if a predefined color scheme has been selected and changed.</li><li>- Export : click to export the current scheme to a file.</li><li>- Rename : click to rename the current scheme. This command is only available for copies or imported schemes, since the predefined schemes cannot be renamed.</li><li>- Delete : click to delete the current scheme. This command is only available for copies or imported schemes, since the predefined schemes cannot be deleted.</li><li>- Import Scheme : click to import a IntelliJ IDEA color scheme (you can either import a file in an internal <code>.icls</code> format, or a <code>.jar</code> created through the File   Export Settings menu), or an Eclipse color scheme in the XML format.</li></ul>

Ctrl+Alt+S 

## Scheme

In this area, choose the code style scheme and change it as required. Code style scheme settings are automatically applied every time IntelliJ IDEA generates, refactors, or reformats your code.

Code styles are defined at the project level and at the IDE level (global).

- At the **Project** level, settings are grouped under the Project scheme, which is predefined and is marked in bold. The **Project** style scheme is applied to the current project only.

You can copy the Project scheme to the IDE level, using the Copy to IDE... command.

- At the **IDE** level, settings are grouped under the predefined Default scheme (marked in bold), and any other scheme created by the user by the Duplicate command (marked as plain text). Global settings are used when the user doesn't want to keep code style settings with the project and share them.

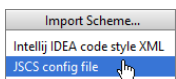

You can copy the IDE scheme to the current project, using the Copy to Project... command.

### ItemDescription

**Scheme** From this drop-down list, select the scheme to be used. The **predefined** schemes are shown bold. The **custom** schemes, ones created as copies of the predefined schemes, are in plain text. The location where the scheme is stored is written next to each scheme, for example, the Default scheme is stored in the IDE, the Project scheme is stored in the project.

 Click this button to invoke the drop-down list of commands to manage the schemes:

#### ItemDescriptionAvailable for

Copy to IDE...	Choose this command to copy the scheme settings to the IDE.	Project
Export...	Choose this command to export the selected scheme to an <code>xml</code> file in the selected location: 	Project and IDE
Import Scheme...	Choose this command to import the scheme of the selected type from the specified location: 	Project and IDE
Copy to Project...	Choose this command to copy the scheme settings to be stored with a project.	IDE
Duplicate...	Choose this command to create a copy of the selected scheme.	IDE
Reset	Choose this command to reset the default or bundled color scheme to the initial defaults shipped with IntelliJ IDEA. This command becomes available only if some changes have been done.	IDE
Rename	Choose this command to change the name of the selected custom scheme. Press <code>Enter</code> to save changes, or <code>Escape</code> to cancel.	Custom schemes

## Line Separators

IntelliJ IDEA lets you configure line separator and indentation options for various languages. When [reformatting source code](#), IntelliJ IDEA will apply the specified indentation behavior and skip the sections denoted with the special formatting off/on markers.

### ItemDescription

**Line Separator (for new files)** Use this drop-down list to specify which [line separator](#) is to be used in files created by IntelliJ IDEA. The available options are:

- System dependent - choose this option to use the default selection.
- Unix and macOS (`\n`) - choose this option to use the Unix and macOS line separator.
- Windows (`\r\n`) - choose this option to use the Windows line separator.
- Classic Mac (`\r`) - choose this option to use the Classic Mac line separator.

**Hard wrap at** In this text box, specify the number of columns to be used to display pages in the editor.

**Wrap on typing** Select this checkbox to ensure that edited text always fits in the specified right margin.

**Visual guides** In this field, specify multiple right margins. You can leave a default value or enter the number of spaces for your margin. If you want to specify several margins, enter numbers separated by comma.

## Indents Detection

Use this area to specify the default options for indentation.

### ItemDescription

Detect and use existing file indents for editing	Select this checkbox for IntelliJ IDEA to detect the existing indents in a file and use them for editing instead of the indents specified in the Code Style settings for the specific language.
Show notifications about detected indents	Select this checkbox to show a notification if IntelliJ IDEA detects indents that are different from the ones specified in the Code Style settings for the specific language.

## Formatter Control

In this area, specify the markers to limit code fragments that you want to exclude from [reformatting](#) . In the source code, formatting markers are written inside [line comments](#) .

### ItemDescription

Enable formatter markers in comments	<ul style="list-style-type: none"> <li>– If this checkbox is selected, fragments of code between line comments with the formatting markers will not be reformatted and will preserve the original formatting. After you select this checkbox, the fields below become available and you can specify the character strings to be treated as formatting markers.</li> <li>– If the checkbox is cleared, the formatting markers will be ignored and the code between the line comments with markers will be reformatted.</li> </ul>
--------------------------------------	--

### Markers

**Formatter off:** In this text box, specify the character string that will indicate the beginning of a code fragment which you want to exclude from reformatting. Type a character string with the `@` symbol in preposition or leave the predefined value `@formatter:off` .

**Formatter on:** In this text box, specify the character string that will indicate the end of a code fragment which you want to exclude from reformatting. Type a character string with the `@` symbol in preposition or leave the predefined value `@formatter:on` .

**Regular expressions** Select this checkbox to use regular expressions instead of specifying the formatting markers explicitly. IntelliJ IDEA matches formatter on/off markers using the regular expression specified instead of the exact string.

## Formatting markers usage example

**The original source code**      **The code after reformatting**

```
//@formatter:off
- "scripts": {
-   "post-install-cmd": [
-     "php artisan optimize"
-   ],
-   "post-update-cmd": [
-     "php artisan clear-compiled",
-     "php artisan optimize"
-   ],
-   "post-create-project-cmd": [
-     "php artisan key:generate"
-   ],
- }
//@formatter:on
```

When the formatting markers are disabled, the original formatting is broken:

```
//@formatter:off
- "scripts": {
-   "post-install-cmd": [
-     "php artisan optimize"
-   ],
-   "post-update-cmd": [
-     "php artisan clear-compiled",
-     "php artisan optimize"
-   ],
-   "post-create-project-cmd": [
-     "php artisan key:generate"
-   ],
- }
//@formatter:on
```

When the formatting markers are enabled, the original formatting is preserved:

```
//@formatter:off
- "scripts": {
-   "post-install-cmd": [
-     "php artisan optimize"
-   ],
-   "post-update-cmd": [
-     "php artisan clear-compiled",
-     "php artisan optimize"
-   ],
-   "post-create-project-cmd": [
-     "php artisan key:generate"
-   ],
- }
//@formatter:on
```

## EditorConfig

In this area enable the support of the EditorConfig plugin.

### ItemDescription

Enable EditorConfig support	Select this checkbox to enable the EditorConfig plugin support. In this case you can specify your own code style settings that override the IDE settings. However, if you decide to use IDE settings after creating the EditorConfig settings file then you need clear the Enable EditorConfig support check box.
-----------------------------	---

**Export** Click this button if you want to export the current IDE code style settings into the `.editconfig` file.

Ctrl+Alt+S 

Use this dialog box to manage the set of code style schemes.

#### ItemDescription

Save As...	Click this button to create a copy of the currently selected scheme. This new scheme can be used for copying a scheme to project, and for <a href="#">export</a> .
Delete	Click this button to remove the currently selected scheme. Note that the predefined schemes cannot be deleted.
Copy to Project	Click this button to copy the settings of the currently selected scheme to project. When the settings are copied, IntelliJ IDEA suggests to switch to this scheme.
Import	Click this button to import IntelliJ IDEA XML code style settings, or JSCS config file.
Export	Click this button to export to IntelliJ IDEA XML code style settings file. The resulting XML file is exported to the specified location and has the specified name. This XML file is used by the <a href="#">Command Line Formatter</a> .
Close	Click this button to close the Code Style Schemes dialog box.

Note that any changes to the set of schemes (creating copies, or deleting unnecessary schemes) only take place on clicking Apply or OK buttons in the [Settings/Preferences dialog](#) .

Ctrl+Alt+S 

Use this page to configure formatting options for HOCON files. View the result in the Preview pane on the right.

**Note** This page appears when the [Scala plugin](#) is enabled.

## Tabs and Indents

### ItemDescription

Use tab character	<ul style="list-style-type: none"> <li>If this checkbox is selected, tab characters are used:           <ul style="list-style-type: none"> <li>On pressing the  key</li> <li>For indentation</li> <li>For code reformatting</li> </ul> </li> <li>When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li> </ul>
Smart tabs	<ul style="list-style-type: none"> <li>If this checkbox is selected, the part of indentation defined by the nesting of code blocks, is made of the tabs and (if necessary) spaces, while the part of indentation defined by the alignment is made only of spaces.</li> <li>If this checkbox is cleared, only tabs are used. This means that a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.</li> </ul> <p>The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.</p>
Tab size	In this text box, specify the number of spaces included in a tab.
Indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
Continuation indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted between the elements of an array, in expressions, method declarations and method calls.

## Spaces

Use this tab to specify where you want spaces in your code. To have IntelliJ IDEA automatically insert a space at a location, select the checkbox next to this location in the list. The results are displayed in the Preview pane.

## Wrapping and braces

In this tab, customize the code style options, which IntelliJ IDEA will apply on [reformatting the source code](#). The left-hand pane contains the list of exceptions (Keep when reformatting), and placement and alignment options for the various code constructs (lists, statements, operations, annotations, etc.) The right-hand pane shows preview.

Alignment takes precedence over indentation options.

## Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by default, the *Line breaks* checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks check box before you [reformat the source code](#).

## Wrapping options

The wrapping style applies to the various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

### ItemDescription

Wrapping style	<p>From this drop-down list, select the desired wrapping style:</p> <ul style="list-style-type: none"> <li>Do not wrap - when this option is selected, no special wrapping style is applied. With this option selected, the nested alignment and braces settings are ignored.</li> <li>Wrap if long - select this option to have lines going beyond the right margin wrapped with proper indentation.</li> <li>Wrap always - select this option to have all elements in lists wrapped so that there is one element per line with proper indentation.</li> <li>Chop down if long - select this option to have elements in lists that go beyond the right margin wrapped so that there is one element per line with proper indentation.</li> </ul>
----------------	--

## Alignment options

### ItemDescription

Align when multiline	If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.
<code>&lt;character(s)&gt;</code> on next line	Select this checkbox to have the specified character or characters moved to the next line when the lines are wrapped.
'else' on new line	Use this checkbox to have the corresponding statements or characters moved to the next line.

New line after <character>	Select this checkbox to have the code after the specified character moved to a new line.
Special else if treatment	If this checkbox is selected, <code>else if</code> statements are located in the same line. Otherwise, <code>else if</code> statements are moved to the next line to the corresponding indent level.
Indent case branches	If this checkbox is selected, the <code>case</code> statement is located at the corresponding indent level. Otherwise, <code>case</code> statement is placed at the same indent level with <code>switch</code> .

## Braces placement options

### ItemDescription

Braces placement style	Use this drop-down list to specify the position of the opening brace in class declarations , method declarations, and other types of declarations. The available options are: <ul style="list-style-type: none"><li>- End of line - select this option to have the opening brace placed at the declaration line end.</li><li>- Next line if wrapped - select this option to have the opening brace placed at the beginning of the line after the multiline declaration line.</li><li>- Next line - select this option to have the opening brace placed at the beginning of the line after the declaration line.</li><li>- Next line shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level.</li><li>- Next line each shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level, and have the next line shifted to the next indent level as well.</li></ul>
------------------------	---

Force braces	From this drop-down list, choose the braces introduction method for <code>if</code> , <code>for</code> , <code>while</code> , and <code>do () while</code> statements. The available options are:
--------------	---

## Blank lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. For each type of location, specify the number of blank lines to be inserted. The results are displayed in the Preview pane.

### ItemDescription

Keep Maximum Blank Lines	In this area, specify the number of blank lines to be kept after reformatting in the specified locations.
--------------------------	---

Ctrl+Alt+S 

Use this page to configure formatting options for Java files. View the result in the Preview pane on the right.

## Tabs and Indents

### ItemDescription

Use tab character	<ul style="list-style-type: none"> <li>- If this checkbox is selected, tab characters are used: <ul style="list-style-type: none"> <li>- On pressing the  key</li> <li>- For indentation</li> <li>- For code reformatting</li> </ul> </li> <li>- When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li> </ul>
Smart tabs	<ul style="list-style-type: none"> <li>- If this checkbox is selected, the part of indentation defined by the nesting of code blocks, is made of the tabs and (if necessary) spaces, while the part of indentation defined by the alignment is made only of spaces.</li> <li>- If this checkbox is cleared, only tabs are used. This means that a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.</li> </ul> <p>The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.</p>
Tab size	In this text box, specify the number of spaces included in a tab.
Indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
Keep indents on empty lines	<ul style="list-style-type: none"> <li>If this checkbox is selected, then IntelliJ IDEA will keep indents on the empty lines as if they contained some code.</li> <li>If this checkbox is not selected, IntelliJ IDEA will delete the tab characters and spaces.</li> </ul>
Label indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted at the next line before a label statement.
Absolute label indent	If this checkbox is selected, label indentation is counted as an absolute number of spaces. Otherwise, label indentation is counted relative to previous indent levels.
Do not indent top level class members	Select this checkbox to have top level class members located at the class declaration indentation level.
Use indents relative to expression start	<ul style="list-style-type: none"> <li>Use this checkbox to switch between the two possible indentation behaviors: <ul style="list-style-type: none"> <li>- If this checkbox is not selected, the blocks of code will be formatted against the closest ancestor block that starts on a new line.</li> <li>- If this checkbox is selected, the blocks of code will be formatted in columns.</li> </ul> </li> </ul>

## Spaces

Use this tab to specify where you want spaces in your code. To have IntelliJ IDEA automatically insert a space at a location, select the checkbox next to this location in the list. The results are displayed in the Preview pane.

## Wrapping and braces

In this tab, customize the code style options, which IntelliJ IDEA will apply on [reformatting the source code](#) . The left-hand pane contains the list of exceptions ( Keep when reformatting ), and placement and alignment options for the various code constructs (lists, statements, operations, annotations, etc.) The right-hand pane shows preview.

Alignment takes precedence over indentation options.

## Right Margin (columns)

Use the Hard wrap at field to specify a margin space required on the right side of an element. If you select Default option then a value of the right margin from the [global settings](#) is used.

## Wrap on typing

Use the Wrap on typing settings to specify how the edited text is fitted in the specified Hard wrap at . You can select one the following options:

- Default - in this case IntelliJ IDEA uses the Wrap on typing option that is specified in the [global settings](#) .
- Yes - in this case IntelliJ IDEA uses the value specified in the Right Margin field.
- No - in this case this option is switched off and a line can exceed the value specified in the right margin.

## Visual guides

Use the Visual guides field to specify multiple right margins. You can leave a default value or enter the number of spaces for your margin. If you want to specify several margins, enter numbers separated by comma.

## Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by

default, the *Line breaks* checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks check box before you [reformat the source code](#) .

## Wrapping options

The wrapping style applies to the various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

### ItemDescription

- Wrapping style From this drop-down list, select the desired wrapping style:
- Do not wrap - when this option is selected, no special wrapping style is applied. With this option selected, the nested alignment and braces settings are ignored.
  - Wrap if long - select this option to have lines going beyond the right margin wrapped with proper indentation.
  - Wrap always - select this option to have all elements in lists wrapped so that there is one element per line with proper indentation.
  - Chop down if long - select this option to have elements in lists that go beyond the right margin wrapped so that there is one element per line with proper indentation.

## Alignment options

### ItemDescription

Align when multiline If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.

<character(s)> on next line Select this checkbox to have the specified character or characters moved to the next line when the lines are wrapped.

'else' on new line Use this checkbox to have the corresponding statements or characters moved to the next line.

New line after <character> Select this checkbox to have the code after the specified character moved to a new line.

Special else if treatment If this checkbox is selected, `else if` statements are located in the same line. Otherwise, `else if` statements are moved to the next line to the corresponding indent level.

Indent case branches If this checkbox is selected, the `case` statement is located at the corresponding indent level. Otherwise, `case` statement is placed at the same indent level with `switch` .

## Braces placement options

### ItemDescription

Braces placement style Use this drop-down list to specify the position of the opening brace in class declarations , method declarations, and other types of declarations. The available options are:

- End of line - select this option to have the opening brace placed at the declaration line end.
- Next line if wrapped - select this option to have the opening brace placed at the beginning of the line after the multiline declaration line.
- Next line - select this option to have the opening brace placed at the beginning of the line after the declaration line.
- Next line shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level.
- Next line each shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level, and have the next line shifted to the next indent level as well.

Force braces From this drop-down list, choose the braces introduction method for `if` , `for` , `while` , and `do () while` statements. The available options are:

## Blank lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. For each type of location, specify the number of blank lines to be inserted. The results are displayed in the Preview pane.

### ItemDescription

Keep Maximum Blank Lines In this area, specify the number of blank lines to be kept after reformatting in the specified locations.

Minimum Blank Lines In the text boxes in this area, specify the number of blank lines to be present in the specified locations.

**Warning!** These settings do not influence the number of blank lines before the first and after the last item.

## JavaDoc

### ItemDescription

Alignment In this area, define how JavaDoc comments should be aligned.

- Align parameter description : select this checkbox to have parameter descriptions aligned against the longest parameter name. Otherwise, the description is separated from the corresponding parameter name by a single space.
- Align thrown exception description : select this checkbox to have thrown exception descriptions aligned against the longest exception name. Otherwise, the description is separated from the exception name by a single space.

Blank Lines	<p>In this area, define where blank lines should be inserted in JavaDoc comments.</p> <ul style="list-style-type: none"> <li>– After description : select this checkbox to have a blank line automatically inserted after the description section of a JavaDoc comment.</li> <li>– After parameter descriptions : select this checkbox to have a blank line inserted after the group of <code>@param</code> tags.</li> <li>– After return tag : select this checkbox to have a blank line inserted after the <code>@return</code> tag.</li> </ul>
Invalid Tags	<p>In this area, define whether invalid tags should be preserved or not.</p> <ul style="list-style-type: none"> <li>– Keep invalid tags : select this checkbox to have the <code>@invalidTag</code> preserved.</li> <li>– Keep empty <code>@param</code> tags : select this checkbox to have <code>@param</code> tags without description preserved.</li> <li>– Keep empty <code>@return</code> tags : select this checkbox to have <code>@return</code> tags without description preserved.</li> <li>– Keep empty <code>@throws</code> tags : select this checkbox to have <code>@throws</code> tags without description preserved.</li> </ul>
Other	<p>In this area, specify additional formatting options for JavaDoc comments.</p> <ul style="list-style-type: none"> <li>– Enable leading asterisks : select this checkbox to have each line of a JavaDoc comment start with an asterisk.</li> <li>– Use <code>@throws</code> rather than <code>@exception</code> : select this checkbox to have the <code>@throws</code> tag used.</li> <li>– Wrap at right margin : select this checkbox to have the text that exceeds the right margin wrapped to the next line.</li> <li>– Generate <code>&lt;/p&gt;</code> on empty lines : select this checkbox to have a <code>&lt;/p&gt;</code> tag automatically inserted in an empty line.</li> <li>– Keep empty lines : select this checkbox to have manually added empty lines preserved.</li> <li>– Do not wrap one-line comment : select this checkbox to have short comments kept in one line with the opening and closing tags.</li> <li>– Preserve line feed : If this checkbox is not selected (by default), line feeds are not preserved on reformatting. This is convenient when comments should be formatted within the boundaries of a paragraph, to occupy minimum space. If this checkbox is selected, line feeds will be preserved.</li> <li>– Parameter description on new line : select this checkbox to instruct the IntelliJ IDEA formatter to place the description of a JavaDoc parameter (if any) to a new line. It uses indent based on the continuation indent value.</li> </ul>

## Arrangement

This tab lets you define a set of rules that rearranges your code according to your preferences.

### ItemDescription

Grouping Rules	<p>Use this area to set the grouping rules.</p> <ul style="list-style-type: none"> <li>– Keep getters and setters together Select this checkbox to keep getter and setter methods together. By default, this checkbox is selected.</li> <li>– Keep overridden methods together Select this checkbox to group the overridden methods together by class and interface. In order: list, select keep or by name options.</li> <li>– Keep dependent methods together Select this checkbox to group the dependent methods together. In order: list, select depth-first or breadth-first options.</li> </ul>
----------------	---

Matching rules	<p>Use this area to define elements order as a list of rules, where every rule has a set of matches such as modifier or type.</p> <ul style="list-style-type: none"> <li>– <b>+</b> - use this button to add a rule. The empty rule area opens.</li> <li>– <b>+</b> - use this button to add a section rule. The section rule lets you move methods or variables into sections that you have defined.</li> </ul>
----------------	--

For example, you can create the following section rule:

After the arrangement, methods in the class will be rearranged as specified in the created section rule and will be surrounded by comments:

```
//methods start
public void test() {}
private int a() { return 1; }
static void r() {}
//methods end
```

- **-** - use this button to remove the rule from the list.
- **✎** - use this button to edit an existing rule. To see this button, navigate to the rule that you want to edit and click on the button. In pop-up window that opens, modify the rule fields.
- **↑↓** - use these buttons to move the selected rule up or down.
- **⚙** - use this button to configure an alias for the matching rule. In this case, when you create an arrangement rule you can define a custom rule (alias) that would include a sequence of different rules and apply the alias to your current rule.

- Empty rule Use this area to create a new matching rule or edit an existing one. You can select from the following filters:
- Type - use this filter to choose classes or methods for your rule.
- Note that clicking a type keyword twice negates the condition.
- Modifier - use this filter to select the types of modifiers for the rule.
- Note that clicking a modifier keyword twice negates the condition.
- Name - use this field to specify entry names in the rule. This filter matches only entry names, such as field names, method names, class names, etc. The filter supports regular expressions and uses a [standard syntax](#). The match is performed against the entire name.
  - Order - use this drop-down list to select the sorting order for the rule. This option is useful when more than one element uses the same matching rule. In this case, selecting Keep order will keep the same order as was set before the rearrangement and selecting Order by Name will sort the elements with the same matching rule by their names.
  - Aliases - this option displays aliases that were defined in the Rules Alias Definition dialog. You can remove the ones you do not need.

 This icon appears when you select Order by Name from the Order list. The icon indicates that the items in this rule are sorted alphabetically.

## Imports

This table lists actions to be performed when [imports are optimized](#).

### ItemDescription

General	<p>In this area, configure general import options.</p> <p>Options:</p> <ul style="list-style-type: none"> <li>– Use single class import : Select this checkbox to have IntelliJ IDEA import only a particular class from a package during code generation or <a href="#">import optimization</a>. Otherwise, a statement importing an entire package is inserted.</li> <li>– Use fully qualified class names : Select this checkbox to have IntelliJ IDEA use the fully qualified name of the class to be imported during code generation or <a href="#">import optimization</a>. Otherwise, a normal import statement is inserted.</li> <li>– Insert imports for inner classes : Select this checkbox to have IntelliJ IDEA create imports for the inner classes referenced in your code.</li> <li>– Use fully qualified names in Javadoc : Select this checkbox to have IntelliJ IDEA use a fully qualified class name in Javadoc. Otherwise, a class is imported.</li> <li>– Class count to use import with "*" : In this text field, specify the number of classes to be imported from a single package until all statements importing a single class are substituted with a statement importing an entire package.</li> <li>– Names count to use static import with "*" : In this text box, specify the number of members to be imported from a single class until all statements importing a single member are substituted with a statement importing an entire class.</li> </ul>
JSP Imports Layout	<p>In this area, configure how JSP import statements should be organized in your code. The introduced changes are displayed in the Preview pane below.</p> <p>Options:</p> <ul style="list-style-type: none"> <li>– Prefer comma separated import list : Select this option to import statements organized in a comma separated list.</li> <li>– Prefer one import statement per page directive : Select this option to have one import statement created per line.</li> </ul>
Packages to Use Import with "*"	<p>In this area, configure a list of packages and classes to be always imported completely.</p> <p>Options:</p> <ul style="list-style-type: none"> <li>– Static : Select this checkbox, if you want to declare static import for the selected class.</li> <li>– Package : In the text fields of this column, specify the packages and classes to be always imported completely.</li> <li>– With Subpackages : Select this checkbox to have all the subpackages of the selected package imported completely.</li> <li>– Add Package : Click this button to add a new entry to the list of packages and classes.</li> <li>– Add Blank : Click this button to add an empty separator to the list of packages and classes.</li> <li>– Remove : Click this button to delete the selected package or class from the list.</li> </ul>
Import Layout	<p>In this area, configure how import statements should be organized in your code. You can set up certain classes to be positioned first, or last, or one after another. Imported classes will be grouped as per their packages and sorted alphabetically within a package.</p> <p>Options:</p> <ul style="list-style-type: none"> <li>– Layout static imports separately : If this checkbox is selected, all static imports will be kept in a separate section. Otherwise, all import statements will be sorted according to the specified layout rules.</li> <li>– Static : Select this checkbox, if you want to declare static import for the selected package.</li> <li>– Package : In the text fields of this column, specify the packages to be imported.</li> <li>– With Subpackages : Select this checkbox to have IntelliJ IDEA apply the layout rules to all the subpackages of the selected package.</li> <li>– Add Package : Click this button to add a new entry to the list of packages.</li> <li>– Add Blank : Click this button to have a blank line inserted after the selected entry, which indicates that a blank line should be inserted between the corresponding import statements.</li> <li>– Move Up / Move Down : Click these buttons to move a package or a blank line up or down in the list thus defining the order of import statements.</li> <li>– Remove : Click this button to delete the selected package from the list.</li> </ul>

## Code Generation

### ItemDescription

Naming	<p>Options:</p> <ul style="list-style-type: none"> <li>– Prefer longer names : select this checkbox to have the longest name highlighted in a lookup list for code</li> </ul>
--------	---

completion. Otherwise, the shortest name is highlighted.

- Name prefix / suffix : in these text boxes, type the prefixes and suffixes to be used when generating suggestions for naming new symbols through the IntelliJ IDEA code-generation features.  
If the fields are left blank, then the default name suggestions without prefixes or suffixes will be used. When you add a prefix value, IntelliJ IDEA automatically converts the first letter of the suggested base name to upper case.

For example, if the prefix for a static field is defined as `s`, and the type of the field is `Counter`, then the suggested static field name will be `sCounter`.

Note that this prefix will not take part in the generation of the getter and setter method names. So, in our example, the accessor names will be `getCounter` and `setCounter` respectively.

Specify the name prefixes and suffixes for fields, static fields, parameters, and local variables.

Final Modifier Options:

- Make generated local variables final - select this checkbox to have local variables in the IntelliJ IDEA-generated code supplied with final modifiers.
- Make generated parameters final - select this checkbox to have parameters in the IntelliJ IDEA-generated code supplied with final modifiers.

Comment Options:

- Line comment at first column - select this checkbox to have **generated line comments** placed in the first column.
- Block comment at first column - select this checkbox to have **generated block comments** placed in the first column.

Order of Specify the necessary order:

- Order of Members - the list defines the order in which code elements appear when IntelliJ IDEA inserts them by itself (for instance, in case of **Intention Actions**).
- Move Up/Move Down - Use these buttons to change the order of members on the list and thus re-define the order in which corresponding elements appear in the generated code.

Other Controls Select the necessary options:

- Use External Annotations - if this checkbox is selected, IntelliJ IDEA will prompt to specify whether you want an **annotation** to be stored in the source code or **externally**. Otherwise, if the checkbox is cleared, annotations are added to the source code by default.
- Insert @Override Annotation - Select this checkbox to have IntelliJ IDEA insert @Override annotations automatically.

## Java EE Names

Use this tab to specify prefixes and suffixes for the names of bean classes, bean interfaces, `<ejb-name>` tags, servlets, filters, and listeners. These prefixes and suffixes will by default appear in the corresponding fields of the **New Bean**, **New Servlet**, **New Filter**, and **New Listener** dialog boxes. For entity beans, you can also specify the default primary key class that appears in the **Create CMP Field** dialog box.

### ItemDescription

Entity Bean Use the text boxes in this area to specify prefixes and/or suffixes to be used in the names of Entity Bean components:

- EJB Class : default suffix `Bean`.
- Home Interface : default suffix `Home`.
- Remote Interface
- Local Home Interface : default prefix `Local`, default suffix `Home`.
- Local Interface : default prefix `Local`.
- `<ejb-name>` tag : default suffix `EJB`.
- Transfer Object : default suffix `vo`.
- Default PK Class : `java.lang.String`.

Session Bean Use the text boxes in this area to specify prefixes and/or suffixes to be used in the names of Session Bean components:

- EJB Class : default suffix `Bean`.
- Home Interface : default suffix `Home`.
- Remote Interface
- Local Home Interface : default prefix `Local`, default suffix `Home`.
- Local Interface : default prefix `Local`.
- Service Endpoint Interface : default suffix `Service`.
- `<ejb-name>` tag : default suffix `EJB`.

Message Driven Bean Use the text boxes in this area to specify prefixes and/or suffixes to be used in the names of Message Driven Bean components:

- EJB Class : default suffix `Bean`.
- `<ejb-name>` tag : default suffix `EJB`.

Servlet Use the text boxes in this area to specify prefixes and/or suffixes to be used in the names of Servlets :

- Servlet Class
- `<servlet-name>` tag

Filter Use the text boxes in this area to specify prefixes and/or suffixes to be used in the names of Filters :

- Filter Class
- `<filter-name>` tag

---

Listener

In this area, specify the prefix and suffix to be used in the names of listener classes.

Ctrl+Alt+S 

Use this page to configure formatting options for ActionScript files. View the result in the Preview pane on the right.

## Tabs and Indents

### ItemDescription

Use tab character	<ul style="list-style-type: none"> <li>- If this checkbox is selected, tab characters are used:             <ul style="list-style-type: none"> <li>- On pressing the  key</li> <li>- For indentation</li> <li>- For code reformatting</li> </ul> </li> <li>- When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li> </ul>
Smart tabs	<ul style="list-style-type: none"> <li>- If this checkbox is selected, the part of indentation defined by the nesting of code blocks, is made of the tabs and (if necessary) spaces, while the part of indentation defined by the alignment is made only of spaces.</li> <li>- If this checkbox is cleared, only tabs are used. This means that a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.</li> </ul> <p>The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.</p>
Tab size	In this text box, specify the number of spaces included in a tab.
Indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
Continuation indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted between the elements of an array, in expressions, method declarations and method calls.

## Spaces

Use this tab to specify where you want spaces in your code. To have IntelliJ IDEA automatically insert a space at a location, select the checkbox next to this location in the list. The results are displayed in the Preview pane.

## Wrapping and braces

In this tab, customize the code style options, which IntelliJ IDEA will apply on [reformatting the source code](#) . The left-hand pane contains the list of exceptions ( Keep when reformatting ), and placement and alignment options for the various code constructs (lists, statements, operations, annotations, etc.) The right-hand pane shows preview.

Alignment takes precedence over indentation options.

## Right Margin (columns)

Use the Hard wrap at field to specify a margin space required on the right side of an element. If you select Default option then a value of the right margin from the [global settings](#) is used.

## Wrap on typing

Use the Wrap on typing settings to specify how the edited text is fitted in the specified Hard wrap at . You can select one of the following options:

- Default - in this case IntelliJ IDEA uses the Wrap on typing option that is specified in the [global settings](#) .
- Yes - in this case IntelliJ IDEA uses the value specified in the Right Margin field.
- No - in this case this option is switched off and a line can exceed the value specified in the right margin.

## Visual guides

Use the Visual guides field to specify multiple right margins. You can leave a default value or enter the number of spaces for your margin. If you want to specify several margins, enter numbers separated by comma.

## Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by default, the *Line breaks* checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks check box before you [reformat the source code](#) .

## Wrapping options

The wrapping style applies to the various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

### ItemDescription

Wrapping style	<p>From this drop-down list, select the desired wrapping style:</p> <ul style="list-style-type: none"> <li>- Do not wrap - when this option is selected, no special wrapping style is applied.</li> <li>- With this option selected, the nested alignment and braces settings are ignored.</li> <li>- Wrap if long - select this option to have lines going beyond the right margin wrapped with proper indentation.</li> </ul>
----------------	---

- Wrap always - select this option to have all elements in lists wrapped so that there is one element per line with proper indentation.
- Chop down if long - select this option to have elements in lists that go beyond the right margin wrapped so that there is one element per line with proper indentation.

## Alignment options

### ItemDescription

Align when multiline	If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.
<character(s)> on next line	Select this checkbox to have the specified character or characters moved to the next line when the lines are wrapped.
'else' on new line	Use this checkbox to have the corresponding statements or characters moved to the next line.
New line after <character>	Select this checkbox to have the code after the specified character moved to a new line.
Special else if treatment	If this checkbox is selected, <code>else if</code> statements are located in the same line. Otherwise, <code>else if</code> statements are moved to the next line to the corresponding indent level.
Indent case branches	If this checkbox is selected, the <code>case</code> statement is located at the corresponding indent level. Otherwise, <code>case</code> statement is placed at the same indent level with <code>switch</code> .

## Braces placement options

### ItemDescription

Braces placement style	Use this drop-down list to specify the position of the opening brace in class declarations, method declarations, and other types of declarations. The available options are: <ul style="list-style-type: none"> <li>- End of line - select this option to have the opening brace placed at the declaration line end.</li> <li>- Next line if wrapped - select this option to have the opening brace placed at the beginning of the line after the multiline declaration line.</li> <li>- Next line - select this option to have the opening brace placed at the beginning of the line after the declaration line.</li> <li>- Next line shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level.</li> <li>- Next line each shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level, and have the next line shifted to the next indent level as well.</li> </ul>
Force braces	From this drop-down list, choose the braces introduction method for <code>if</code> , <code>for</code> , <code>while</code> , and <code>do () while</code> statements. The available options are:

## Blank lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. For each type of location, specify the number of blank lines to be inserted. The results are displayed in the Preview pane.

### ItemDescription

Keep Maximum Blank Lines	In this area, specify the number of blank lines to be kept after reformatting in the specified locations.
Minimum Blank Lines	In the text boxes in this area, specify the number of blank lines to be present in the specified locations. <div style="background-color: yellow; padding: 5px; margin-top: 5px;"> <b>Warning!</b> These settings do not influence the number of blank lines before the first and after the last item. </div>

## Other

### Item Description

Indent package statement children	Select this checkbox to have the nested statements of package statements indented on code reformatting.
Align C-style comments /*...*/	Select this checkbox to adjust lines in C-style comments.
Align object properties	From the drop-down list, select the type of objects' alignment: <ul style="list-style-type: none"> <li>- Do not align : the attributes in sequential lines will be not aligned.</li> <li>- On colon : the attributes in sequential lines will be aligned against the colon.</li> <li>- On value : the attributes in sequential lines will be aligned against the value.</li> </ul>
Field prefix	In this text box, specify the prefix to be used in ActionScript fields.
Property prefix	In this text box, specify the prefix to be used in ActionScript properties.
Use semicolon to terminate statements	Select this checkbox to have statements terminated with a semicolon.
Spaces before type reference colon ':'	Select this checkbox to separate type reference with the space before colon.
Spaces after type reference colon ':'	Select this checkbox to separate type reference with the space after colon.

## Arrangement

This tab lets you define a set of rules that rearranges your code according to your preferences.

### ItemDescription

---

Grouping Use this area to set the grouping rules.  
Rules

- Group property field with corresponding getter/setter

---

Matching rules Use this area to define elements order as a list of rules, where every rule has a set of matches such as modifier or type.

-  - use this button to add a rule. The empty rule area opens.
-  - use this button to remove the rule from the list.
-  - use this button to edit an existing rule. To see this button, navigate to the rule that you want to edit and click on the button. In pop-up window that opens, modify the rule fields.
-  - use these buttons to move the selected rule up or down.

---

Empty rule Use this area to create a new matching rule or edit an existing one. You can select from the following filters:

- Type - use this filter to choose classes or methods for your rule.  
  
Note that clicking a type keyword twice negates the condition.
- Modifier - use this filter to select the types of modifiers for the rule.  
  
Note that clicking a modifier keyword twice negates the condition.
- Name - use this field to specify entry names in the rule. This filter matches only entry names, such as field names, method names, class names, etc. The filter supports regular expressions and uses a [standard syntax](#). The match is performed against the entire name.
- Order - use this drop-down list to select the sorting order for the rule. This option is useful when more than one element uses the same matching rule. In this case, selecting Keep order will keep the same order as was set before the rearrangement and selecting Order by Name will sort the elements with the same matching rule by their names.
- Aliases - this option displays aliases that were defined in the Rules Alias Definition dialog. You can remove the ones you do not need.

---

 This icon appears when you select Order by Name from the Order list. The icon indicates that the items in this rule are sorted alphabetically.

Ctrl+Alt+S 

Use this page to configure formatting options for CFML files. View the result in the Preview pane on the right.

## Spaces

Use this tab to specify where you want spaces in your code. To have IntelliJ IDEA automatically insert a space at a location, select the checkbox next to this location in the list. The results are displayed in the Preview pane.

## Wrapping and braces

In this tab, customize the code style options, which IntelliJ IDEA will apply on [reformatting the source code](#). The left-hand pane contains the list of exceptions (Keep when reformatting), and placement and alignment options for the various code constructs (lists, statements, operations, annotations, etc.) The right-hand pane shows preview.

Alignment takes precedence over indentation options.

## Right Margin (columns)

Use the Hard wrap at field to specify a margin space required on the right side of an element. If you select Default option then a value of the right margin from the [global settings](#) is used.

## Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by default, the *Line breaks* checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks check box before you [reformat the source code](#).

## Wrapping options

The wrapping style applies to the various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

### ItemDescription

Wrapping style	From this drop-down list, select the desired wrapping style: <ul style="list-style-type: none"> <li>– Do not wrap - when this option is selected, no special wrapping style is applied. With this option selected, the nested alignment and braces settings are ignored.</li> <li>– Wrap if long - select this option to have lines going beyond the right margin wrapped with proper indentation.</li> <li>– Wrap always - select this option to have all elements in lists wrapped so that there is one element per line with proper indentation.</li> <li>– Chop down if long - select this option to have elements in lists that go beyond the right margin wrapped so that there is one element per line with proper indentation.</li> </ul>
----------------	---

## Alignment options

### ItemDescription

Align when multiline	If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.
<code>&lt;character(s)&gt;</code> on next line	Select this checkbox to have the specified character or characters moved to the next line when the lines are wrapped.
'else' on new line	Use this checkbox to have the corresponding statements or characters moved to the next line.
New line after <code>&lt;character&gt;</code>	Select this checkbox to have the code after the specified character moved to a new line.
Special else if treatment	If this checkbox is selected, <code>else if</code> statements are located in the same line. Otherwise, <code>else if</code> statements are moved to the next line to the corresponding indent level.
Indent case branches	If this checkbox is selected, the <code>case</code> statement is located at the corresponding indent level. Otherwise, <code>case</code> statement is placed at the same indent level with <code>switch</code> .

## Braces placement options

### ItemDescription

Braces placement style	Use this drop-down list to specify the position of the opening brace in class declarations, method declarations, and other types of declarations. The available options are: <ul style="list-style-type: none"> <li>– End of line - select this option to have the opening brace placed at the declaration line end.</li> <li>– Next line if wrapped - select this option to have the opening brace placed at the beginning of the line after the multiline declaration line.</li> <li>– Next line - select this option to have the opening brace placed at the beginning of the line after the declaration line.</li> <li>– Next line shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level.</li> <li>– Next line each shifted - select this option to have the opening brace placed at the line after the declaration line being shifted to the corresponding indent level, and have the next line shifted to the next indent level as well.</li> </ul>
------------------------	--

Force braces From this drop-down list, choose the braces introduction method for `if` , `for` , `while` , and `do () while` statements. The available options are:

## Blank lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. For each type of location, specify the number of blank lines to be inserted. The results are displayed in the Preview pane.

### ItemDescription

---

Keep Maximum Blank Lines In this area, specify the number of blank lines to be kept after reformatting in the specified locations.

---

In code Use this field to set the number of the blank lines.

## Set from...

Click this link to choose the base for the current language default code style from the pop-up list, that appears. The list contains two options:

- Language: choose this option to inherit the coding style settings from another language. Select the source language from the list, that opens. So doing, only the settings that are applicable to the current language are taken. All the other settings are not affected.
- Predefined code style: choose this option to use the coding standards defined for a specific framework. Select one of the following frameworks from the list:
  - [PEAR](#)
  - [Zend](#)
  - [PSR1 /PSR2](#)
  - [Symfony2](#)
  - [Joomla!](#)

This link appears in the upper-right corner of the language-specific code style page, when applicable.

Click Reset to discard changes and return to the initial set of code style settings.

Ctrl+Alt+S 

Use this page to configure formatting options for CoffeeScript files. View the result in the Preview pane on the right.

## Tabs and Indents

Use tab character	<ul style="list-style-type: none"> <li>– If this checkbox is selected, tab characters are used for indentation and for code reformatting.</li> <li>– When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li> </ul>
Smart tabs	<p>An indentation consists of two parts. One part results from nesting code blocks and the other part is determined by alignment.</p> <ul style="list-style-type: none"> <li>– If this checkbox is selected, the part that results from nesting contains both tabs and spaces (if necessary), while the part defined by alignment consists only of spaces.</li> <li>– If this checkbox is cleared, only tabs are used. This means that after reformatting a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.</li> </ul>
Tab size	In this text box, specify the number of spaces that fits in a tab.
Indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
Continuation indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted between the elements of an array, in expressions, method declarations, and method calls.
Keep indents on empty lines	If this checkbox is selected, IntelliJ IDEA retains indents on empty lines as if they contained some code. If the checkbox is cleared, IntelliJ IDEA deletes the tab characters and spaces on empty lines.
Indent chained methods	<p>In declarations of functions, the second and further methods in a chain are displayed on a separate line.</p> <ul style="list-style-type: none"> <li>– When the checkbox is selected, the second and further methods in a chain are aligned with the first call.</li> <li>– When the checkbox is cleared, the second and further methods in a chain are aligned with the object on which they are invoked.</li> </ul>

**Tip** The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.

## Spaces

Use this tab to specify where you want IntelliJ IDEA to insert spaces automatically. Select the checkboxes next to the description of relevant locations and check the results in the Preview pane.

### Wrapping and braces

In this tab, customize the exceptions, brace placement and alignment options that IntelliJ IDEA will apply to various code constructs on [reformatting the source code](#). Check the results in the Preview pane.

**Tip** Alignment takes precedence over indentation options.

#### Hard wrap at

In this field, specify the number of spaces required to the right of an element. If you accept the Default option then the value from the [global settings](#) is used.

#### Wrap on typing

In this field, specify how the edited text is fitted in the specified Hard wrap at field.

- Default - choose this option to use the Wrap on typing value from the [global settings](#).
- Yes - choose this option to use the value from the Right Margin field.
- No - if you choose this option a line can exceed the value specified in the right margin.

**Visual guides** In this field, specify multiple right margins. You can leave a default value or enter the number of spaces for your margin. If you want to specify several margins, enter numbers separated by comma.

#### Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by default, the Line breaks checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks checkbox before reformatting.

#### Wrapping options

A wrapping style applies to various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

Do not wrap	When this option is selected, no special wrapping style is applied, the nested alignment and braces settings
-------------	--

are ignored.

Wrap if long	Select this option to wrap lines going beyond the right margin with proper indentation.
Wrap always	Select this option to wrap all elements in lists so that there is one element per line with proper indentation.
Chop down if long	Select this option to wrap elements in lists that go beyond the right margin so that there is one element per line with proper indentation.

## Alignment options

Align when multiline	If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.
<character(s)> on next line	Select this checkbox to move the specified character or characters to the next line when the lines are wrapped.
'else' on new line	Use this checkbox to move the corresponding statements or characters to the next line.
New line after <character>	Select this checkbox to move the code after the specified character to a new line.
Special else if treatment	If this checkbox is selected, <code>else if</code> statements are located in the same line. Otherwise, <code>else if</code> statements are moved to the next line to the corresponding indent level.
Variable declarations	Choose one of the following options to configure alignment for equality signs: <ul style="list-style-type: none"><li>– Do not align - the equality signs are not aligned.</li><li>– Align when multiline - the equality signs in multiline <code>var</code> statements are aligned by inserting additional spaces.</li><li>– Align when grouped - the equality signs in multiple <code>var</code> statements are aligned by inserting additional spaces.</li></ul>

**ES6 import/export** Align 'from' clauses: When this checkbox is selected, IntelliJ IDEA aligns `import` and `export` statements in [ECMAScript 6](#) code automatically making your code easier to read and maintain. Compare the appearance of a code fragment with alignment and without it in the Preview pane.

With this option on, IntelliJ IDEA will align the new code on the fly. Existing `import` and `export` statements will be aligned after you reformat the code by pressing `Ctrl+Alt+L`, see the [Reformat Source Code](#) section for details.

## Braces placement options

Braces placement style	Use this drop-down list to specify the position of the opening brace in class declarations, method declarations, function declarations, and other types of declarations. The available options are: <ul style="list-style-type: none"><li>– End of line - select this option to place the opening brace at the declaration line end.</li><li>– Next line if wrapped - select this option to place the opening brace at the beginning of the line after the multiline declaration line.</li><li>– Next line - select this option to place the opening brace at the beginning of the line after the declaration line.</li><li>– Next line shifted - select this option to place the opening brace at the line after the declaration line being shifted to the corresponding indent level.</li><li>– Next line each shifted - select this option to place the opening brace at the line after the declaration line being shifted to the corresponding indent level, and shift the next line to the next indent level as well.</li></ul>
Force braces	From this drop-down list, choose the braces introduction method for <code>if</code> , <code>for</code> , <code>while</code> , and <code>do ()</code> <code>while</code> statements. The available options are: <ul style="list-style-type: none"><li>– Do not force - select this option to suppress introducing braces automatically.</li><li>– When multiline - select this option to insert braces automatically if a statement occupies more than one line. Note that IntelliJ IDEA analyzes the number of lines in the entire statement but not only its condition.</li><li>– Always - when this checkbox is selected, IntelliJ IDEA always inserts braces automatically.</li></ul>

## Blank Lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. The results are displayed in the Preview pane.

**Keep Maximum Blank Lines** In this area, specify the number of extra blank lines to be kept after reformatting.

**Tip** These settings do not affect the number of blank lines before the first and after the last item.

## Other

### Item Description

**Align object properties** From the drop-down list, select the type of objects' alignment:

- Do not align : the attributes in sequential lines will be not aligned.

- On colon : the attributes in sequential lines will be aligned against the colon.
- On value : the attributes in sequential lines will be aligned against the value.

---

Line comments at first column      Select this checkbox to place a line comment in the first column.

## Set from

The link appears in the upper-right corner of the page, when applicable. Click this link and choose the language to be used as the base for the current language code style.

To return to the initial set of code style settings and discard the changes, click [Reset](#) .

Ctrl+Alt+S 

Use this page to configure formatting options for CSS files. View the result in the Preview pane on the right.

## Tabs and Indents

Use tab character	<ul style="list-style-type: none"> <li>– If this checkbox is selected, tab characters are used for indentation and for code reformatting.</li> <li>– When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li> </ul>
Smart tabs	<p>An indentation consists of two parts. One part results from nesting code blocks and the other part is determined by alignment.</p> <ul style="list-style-type: none"> <li>– If this checkbox is selected, the part that results from nesting contains both tabs and spaces (if necessary), while the part defined by alignment consists only of spaces.</li> <li>– If this checkbox is cleared, only tabs are used. This means that after reformatting a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.</li> </ul>
Tab size	In this text box, specify the number of spaces that fits in a tab.
Indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
Continuation indent	In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted between the elements of an array, in expressions, method declarations, and method calls.
Keep indents on empty lines	If this checkbox is selected, IntelliJ IDEA retains indents on empty lines as if they contained some code. If the checkbox is cleared, IntelliJ IDEA deletes the tab characters and spaces on empty lines.

**Tip** The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.

## Other

In this tab, specify the alignment, braces and spaces options to be applied on reformatting.

### ItemDescription

Braces placement	<p>Use this drop-down list to specify where IntelliJ IDEA should place the opening braces of selectors. The available options are:</p> <ul style="list-style-type: none"> <li>– At the end of line</li> <li>– Next line</li> </ul>
Align values	<p>Use this drop-down list to specify how IntelliJ IDEA should align attributes and values. The available options are:</p> <ul style="list-style-type: none"> <li>– Do not align : select this option to specify alignment on the first character of an attribute name.</li> <li>– On value : select this option to specify alignment on the first character of the value of an attribute.</li> <li>– On colon</li> </ul>
Blank lines between blocks	In this text box, specify the minimum number of sequential blank lines to be retained after reformatting.
Align closing brace with properties	<p>If this checkbox is selected, the closing brace of the selector will be placed under the list of properties.</p> <p>If this checkbox is not selected, the closing brace of the selector will be placed under the selector.</p>
Keep single-line blocks	<p>If this checkbox is selected, the blocks with a single property will be confined to one line.</p> <p>If this checkbox is not selected, each property will be placed to its own line.</p>
Spaces	Select the checkboxes in this area to add a space after the colon delimiting key and value, and before the opening brace of the selector.
HEX Colors	<p>Use this area to configure the hex color syntax. You can select from the following check options:</p> <ul style="list-style-type: none"> <li>– Convert hex colors to - select this checkbox to configure the hex color letter case. You can choose Lower case or Upper case .</li> <li>– Convert hex colors format to - select this checkbox to configure the hex color format length. You can choose Long format or Short format .</li> </ul> <p>View changes in the Preview pane.</p>

## Set from

The link appears in the upper-right corner of the page, when applicable. Click this link and choose the language to be used as the base for the current language code style.

To return to the initial set of code style settings and discard the changes, click Reset .

Ctrl+Alt+S 

Use this page to configure formatting options for Dart files. View the result in the Preview pane on the right.

## Dartfmt

In this tab choose whether you want to format your Dart code using the [dartfmt tool](#).

- Use the `dartfmt` tool when formatting the whole file
- When the checkbox is selected, `dartfmt` is applied when you reformat an entire file by pressing `Ctrl+Alt+L` or choosing Code | Reformat Code. For reformatting a selected fragment of code the IntelliJ IDEA internal formatter is still used.
  - When this checkbox is cleared, `dartfmt` is never used and the code is always reformatted by the IntelliJ IDEA internal formatter.

**Tip** The file will be reformatted successfully only if the code is syntactically correct.

## Tabs and Indents

- Use tab character
- If this checkbox is selected, tab characters are used for indentation and for code reformatting.
  - When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.
- 
- Smart tabs
- An indentation consists of two parts. One part results from nesting code blocks and the other part is determined by alignment.
- If this checkbox is selected, the part that results from nesting contains both tabs and spaces (if necessary), while the part defined by alignment consists only of spaces.
  - If this checkbox is cleared, only tabs are used. This means that after reformatting a group of spaces that fits the specified tab size is automatically replaced with a tab, which may result in breaking fine alignment.
- 
- Tab size
- In this text box, specify the number of spaces that fits in a tab.
- 
- Indent
- In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted for each indent level.
- 
- Continuation indent
- In this text box, specify the number of spaces (or tabs if the Use Tab Character checkbox is selected) to be inserted between the elements of an array, in expressions, method declarations, and method calls.
- 
- Keep indents on empty lines
- If this checkbox is selected, IntelliJ IDEA retains indents on empty lines as if they contained some code. If the checkbox is cleared, IntelliJ IDEA deletes the tab characters and spaces on empty lines.

**Tip** The Smart Tabs checkbox is available if the Use Tab Character checkbox is selected.

## Spaces

Use this tab to specify where you want IntelliJ IDEA to insert spaces automatically. Select the checkboxes next to the description of relevant locations and check the results in the Preview pane.

## Wrapping and braces

In this tab, customize the exceptions, brace placement and alignment options that IntelliJ IDEA will apply to various code constructs on [reformatting the source code](#). Check the results in the Preview pane.

**Tip** Alignment takes precedence over indentation options.

### Hard wrap at

In this field, specify the number of spaces required to the right of an element. If you accept the Default option then the value from the [global settings](#) is used.

### Wrap on typing

In this field, specify how the edited text is fitted in the specified Hard wrap at field.

- Default - choose this option to use the Wrap on typing value from the [global settings](#).
- Yes - choose this option to use the value from the Right Margin field.
- No - if you choose this option a line can exceed the value specified in the right margin.

**Visual guides** In this field, specify multiple right margins. You can leave a default value or enter the number of spaces for your margin. If you want to specify several margins, enter numbers separated by comma.

### Keep when reformatting

Use the checkboxes to configure exceptions that IntelliJ IDEA will make when reformatting the source code. For example, by default, the Line breaks checkbox is selected. If your code contains lines that are shorter than a standard convention, you can convert them by disabling the Line breaks checkbox before reformatting.

## Wrapping options

A wrapping style applies to various code constructs, specified in the left-hand pane (for example, method call arguments, or assignment statements).

Do not wrap	When this option is selected, no special wrapping style is applied, the nested alignment and braces settings are ignored.
Wrap if long	Select this option to wrap lines going beyond the right margin with proper indentation.
Wrap always	Select this option to wrap all elements in lists so that there is one element per line with proper indentation.
Chop down if long	Select this option to wrap elements in lists that go beyond the right margin so that there is one element per line with proper indentation.

## Alignment options

Align when multiline	If this checkbox is selected, a code construct starts at the same column on each next line. Otherwise, the position of a code construct is determined by the current indentation level.
<character(s)> on next line	Select this checkbox to move the specified character or characters to the next line when the lines are wrapped.
'else' on new line	Use this checkbox to move the corresponding statements or characters to the next line.
New line after <character>	Select this checkbox to move the code after the specified character to a new line.
Special else if treatment	If this checkbox is selected, <code>else if</code> statements are located in the same line. Otherwise, <code>else if</code> statements are moved to the next line to the corresponding indent level.
Variable declarations	Choose one of the following options to configure alignment for equality signs: <ul style="list-style-type: none"><li>– Do not align - the equality signs are not aligned.</li><li>– Align when multiline - the equality signs in multiline <code>var</code> statements are aligned by inserting additional spaces.</li><li>– Align when grouped - the equality signs in multiple <code>var</code> statements are aligned by inserting additional spaces.</li></ul>

ES6 import/export Align 'from' clauses: When this checkbox is selected, IntelliJ IDEA aligns `import` and `export` statements in [ECMAScript 6](#) code automatically making your code easier to read and maintain. Compare the appearance of a code fragment with alignment and without it in the Preview pane.

With this option on, IntelliJ IDEA will align the new code on the fly. Existing `import` and `export` statements will be aligned after you reformat the code by pressing `Ctrl+Alt+L`, see the [Reformat Source Code](#) section for details.

## Braces placement options

Braces placement style	Use this drop-down list to specify the position of the opening brace in class declarations, method declarations, function declarations, and other types of declarations. The available options are: <ul style="list-style-type: none"><li>– End of line - select this option to place the opening brace at the declaration line end.</li><li>– Next line if wrapped - select this option to place the opening brace at the beginning of the line after the multiline declaration line.</li><li>– Next line - select this option to place the opening brace at the beginning of the line after the declaration line.</li><li>– Next line shifted - select this option to place the opening brace at the line after the declaration line being shifted to the corresponding indent level.</li><li>– Next line each shifted - select this option to place the opening brace at the line after the declaration line being shifted to the corresponding indent level, and shift the next line to the next indent level as well.</li></ul>
------------------------	--

Force braces	From this drop-down list, choose the braces introduction method for <code>if</code> , <code>for</code> , <code>while</code> , and <code>do ()</code> <code>while</code> statements. The available options are: <ul style="list-style-type: none"><li>– Do not force - select this option to suppress introducing braces automatically.</li><li>– When multiline - select this option to insert braces automatically if a statement occupies more than one line. Note that IntelliJ IDEA analyzes the number of lines in the entire statement but not only its condition.</li><li>– Always - when this checkbox is selected, IntelliJ IDEA always inserts braces automatically.</li></ul>
--------------	--

## Blank Lines

Use this tab to define where and how many blank lines you want IntelliJ IDEA to retain and insert in your code after reformatting. The results are displayed in the Preview pane.

Keep Maximum Blank Lines	In this area, specify the number of extra blank lines to be kept after reformatting.
--------------------------	--

**Tip** These settings do not affect the number of blank lines before the first and after the last item.

## Code Generation

On this tab, configure the code style for generated code.

---

Insert `@override` annotation

## Set from

The link appears in the upper-right corner of the page, when applicable. Click this link and choose the language to be used as the base for the current language code style.

To return to the initial set of code style settings and discard the changes, click `Reset`.

Ctrl+Alt+S 

Use this page to configure formatting options for ERB files. View the result in the Preview pane on the right.

## Tabs and Indents

### ItemDescription

Use tab character	<ul style="list-style-type: none"><li>- If this checkbox is selected, tab characters are used:<ul style="list-style-type: none"><li>- On pressing the  key</li><li>- For indentation</li><li>- For code reformatting</li></ul></li><li>- When the checkbox is cleared, IntelliJ IDEA uses spaces instead of tabs.</li></ul>
